

Python Turtle: Colourful Spiral Fun!

What is Python?

Python is a language computers
understand to do fun things!
We can tell computers what to do
by writing Python code.

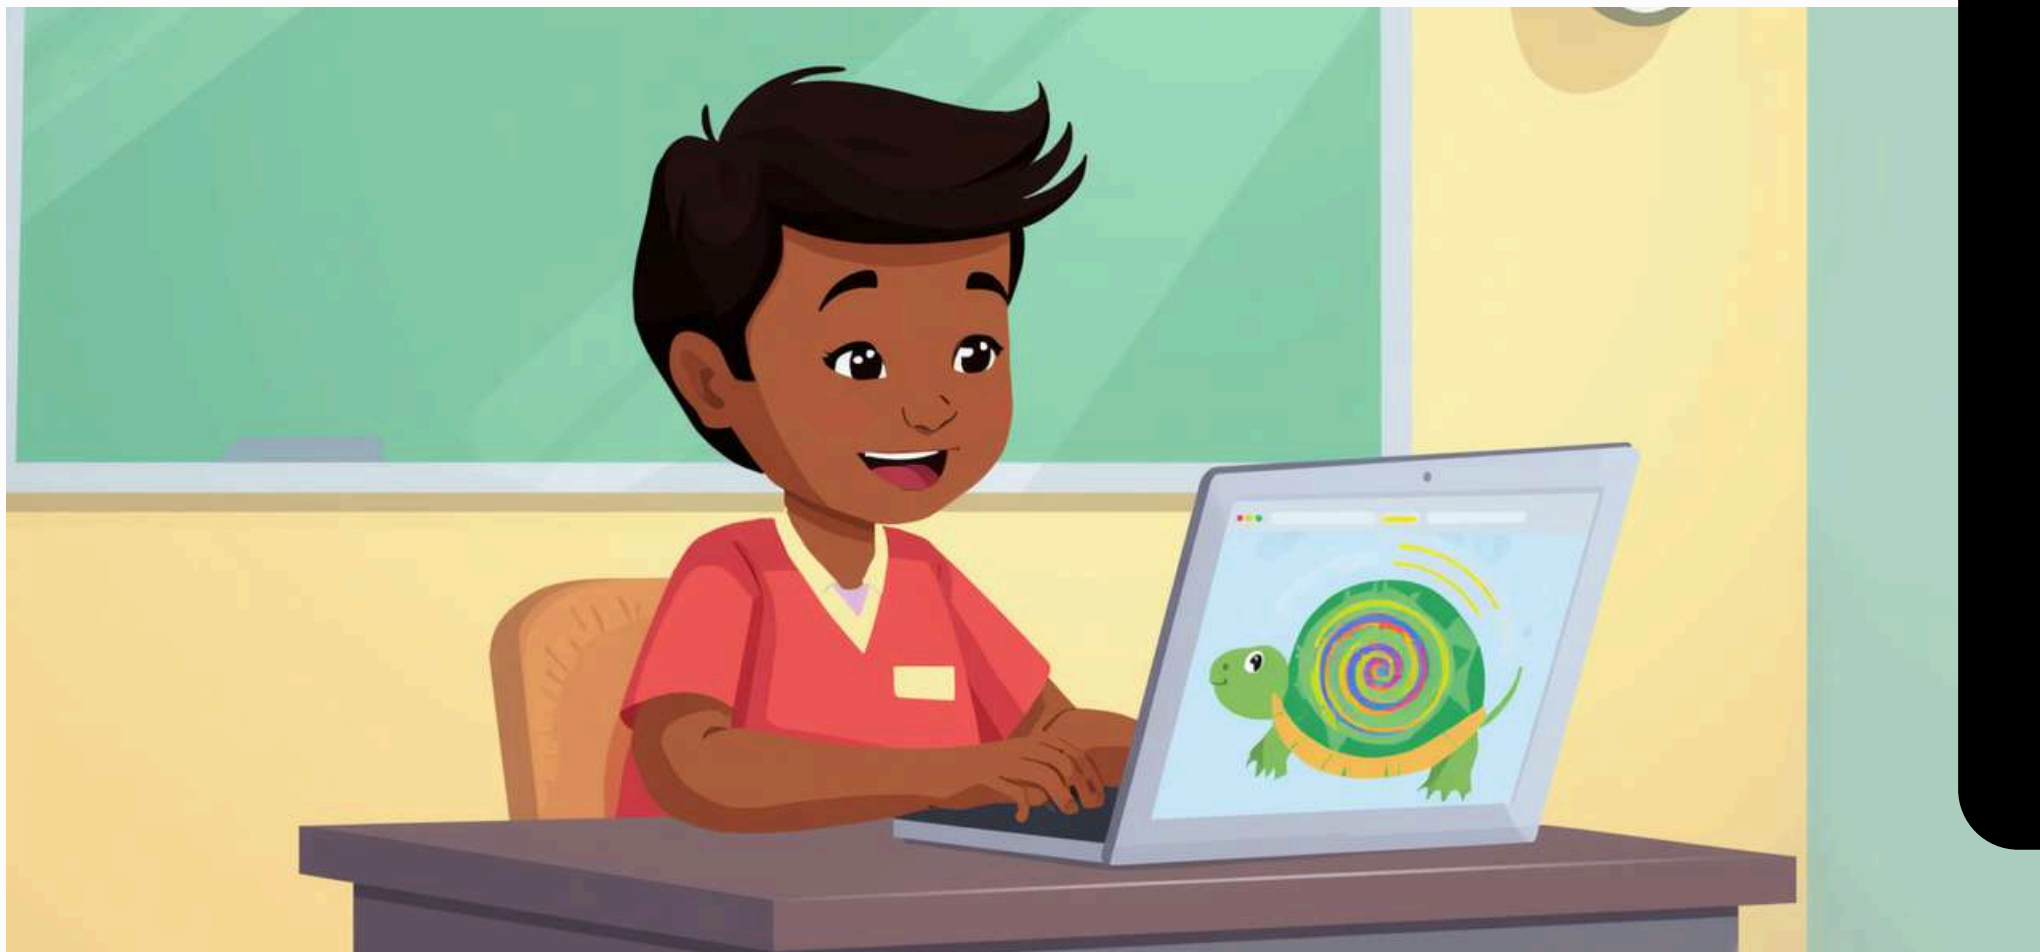

Meet Turtle Graphics!

**Turtle is like a magical pen
that draws on the screen!**

**It follows your instructions
and leaves a colourful trail
as it moves around!**

Drawing with Turtle Graphics!

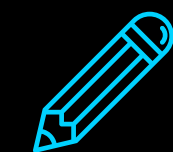

Move Forward & Turn

Turtle can move forward and turn left or right. Each move takes it to a new spot on the screen!

Draws Lines as It Moves

As Turtle walks across the screen, it leaves a line behind — just like drawing with a pen on paper!

Change the Pen Color!

We can tell Turtle which color to use. Try red, blue, green — make your drawing super colorful!

What is a Spiral?

A spiral is a curve that goes round and round, getting bigger and bigger!
Look at the colourful spiral — see how it starts small in the middle and grows outward?
We will draw one like this using Python Turtle!

Step 1 — Import Turtle

Type this first line in your code editor:
`import turtle`

This tells Python to use the
Turtle drawing tool.
Now we are ready to draw!

Step 2 —

Create the Turtle!

```
t = turtle.Turtle()
```

🐢 We make a turtle named t that will draw for us!
"t = turtle.Turtle()"

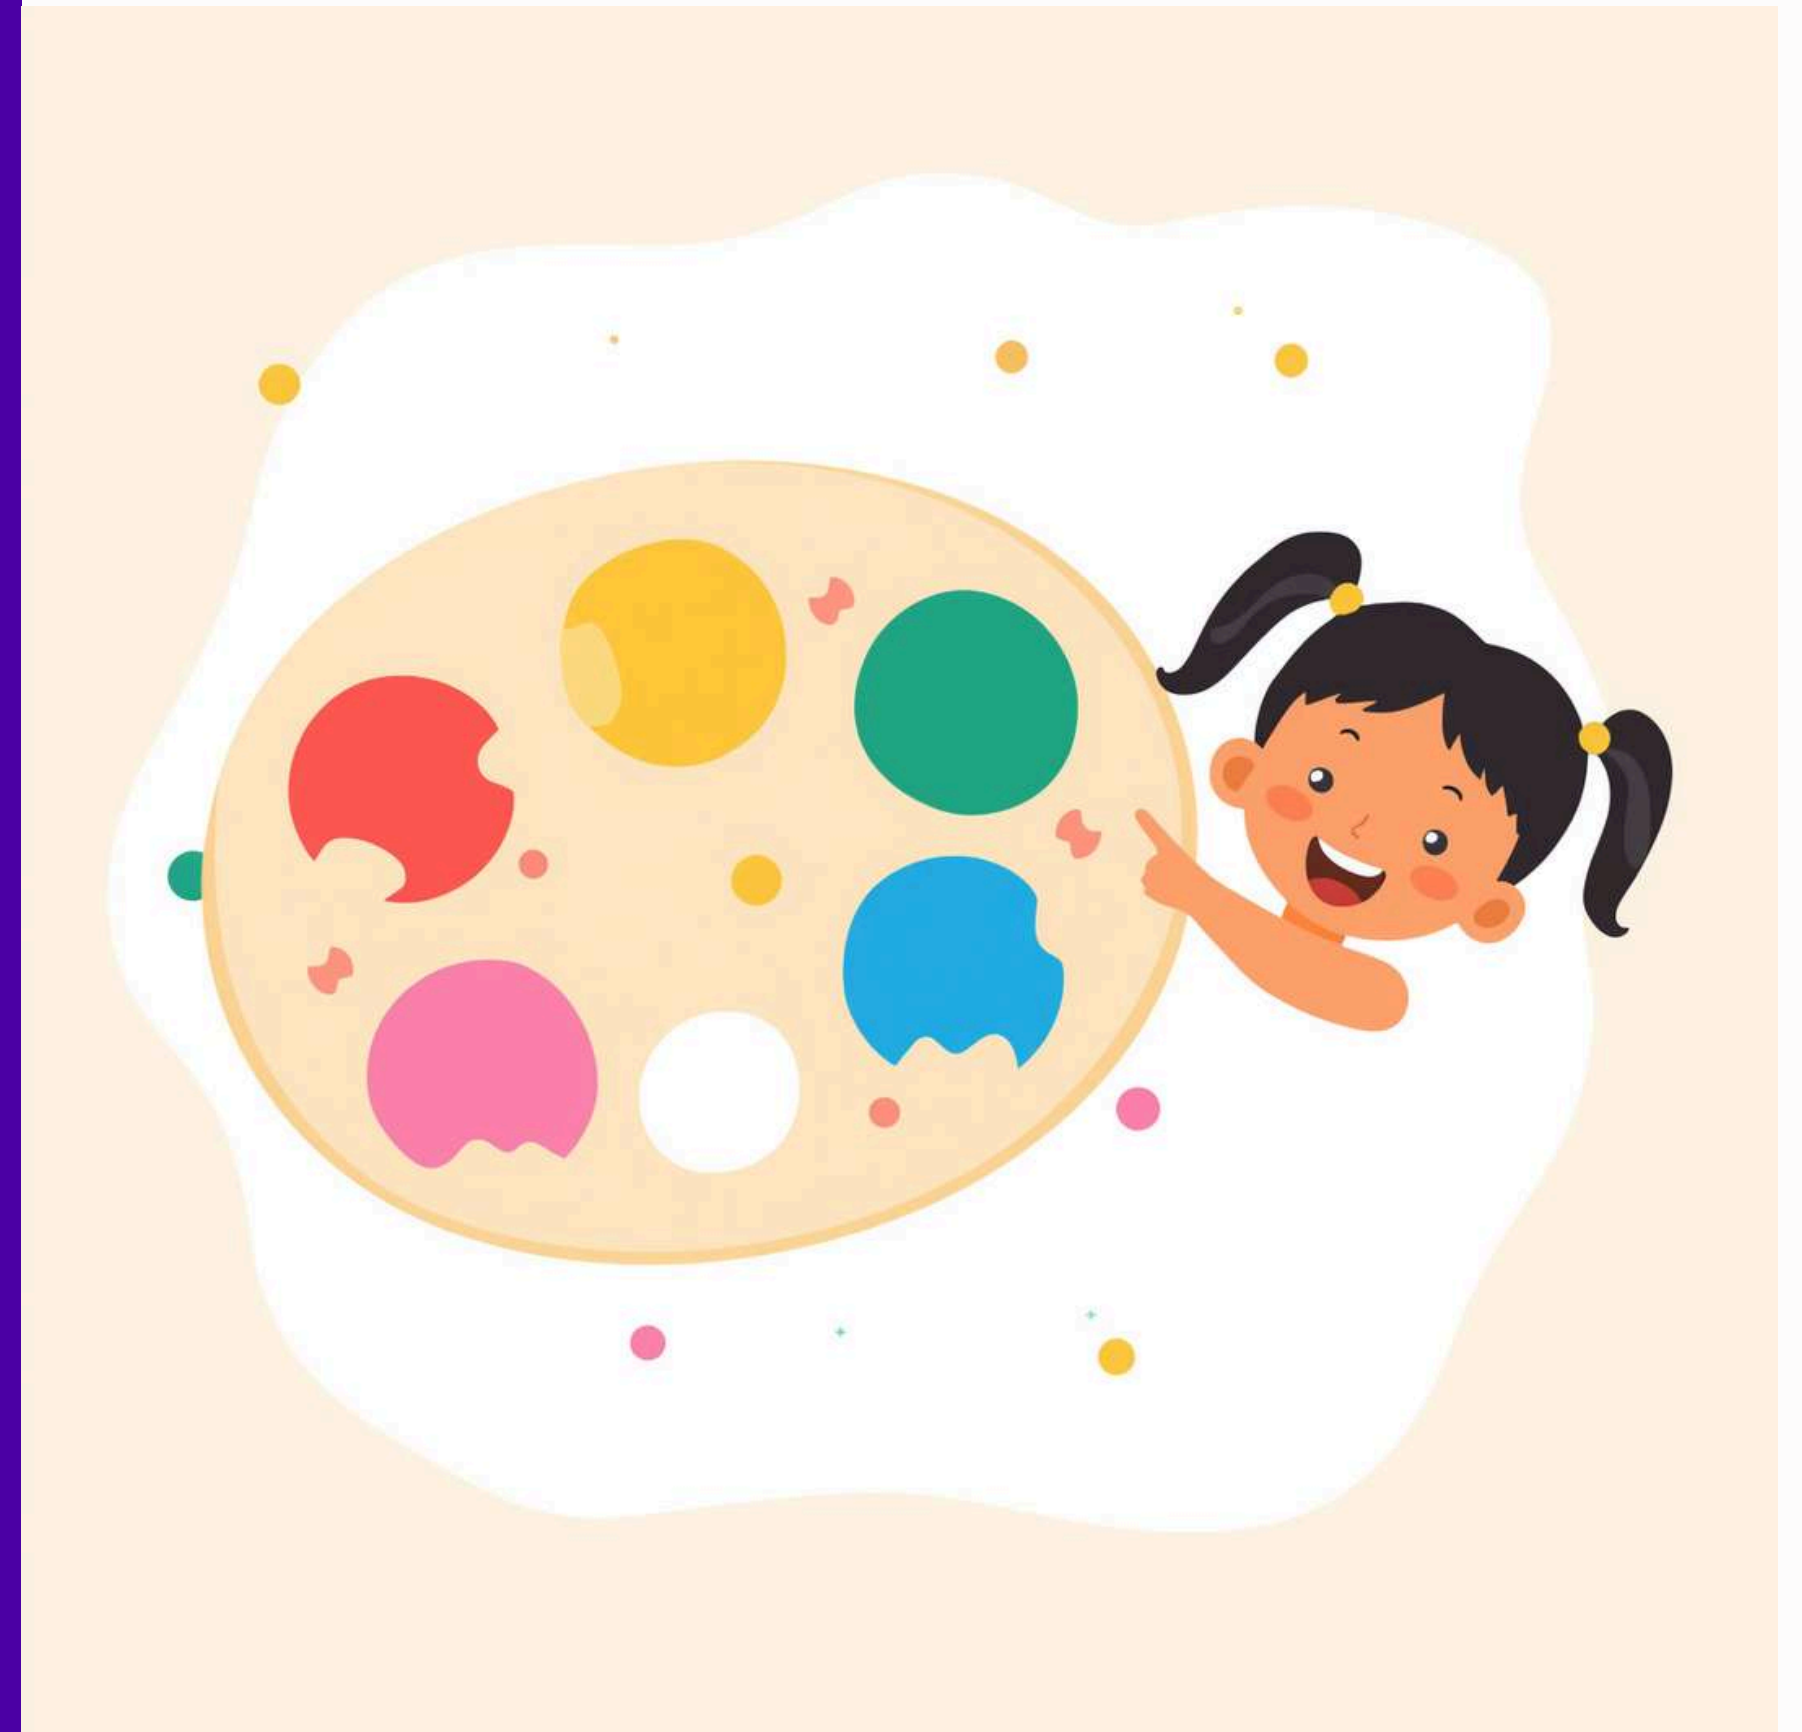

This creates your very own turtle — ready to draw
colourful spirals on screen!

Step 3 — Make It Colourful!

```
colors = ['red', 'orange', 'yellow',  
'green', 'blue', 'purple']
```

We choose a list of colors for our spiral.
Each time the turtle moves, it picks the
next color from this list — making our
spiral bright and beautiful!

Step 4 -

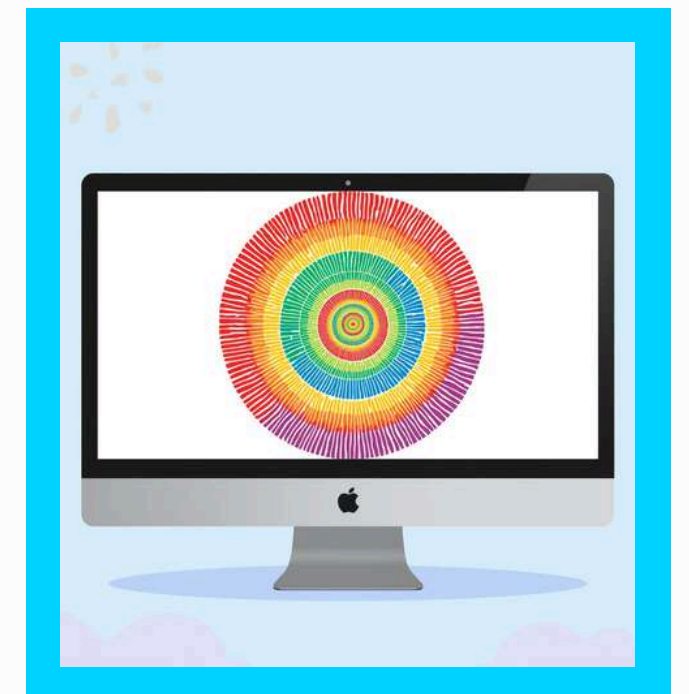

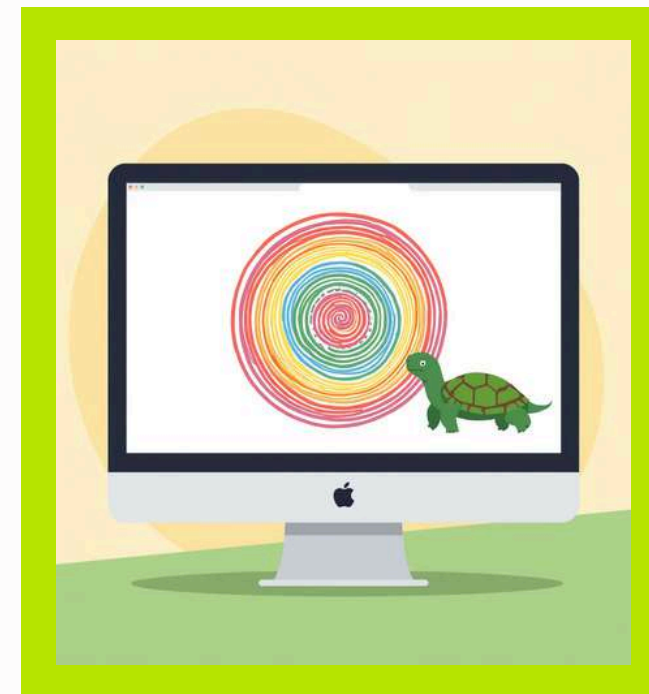

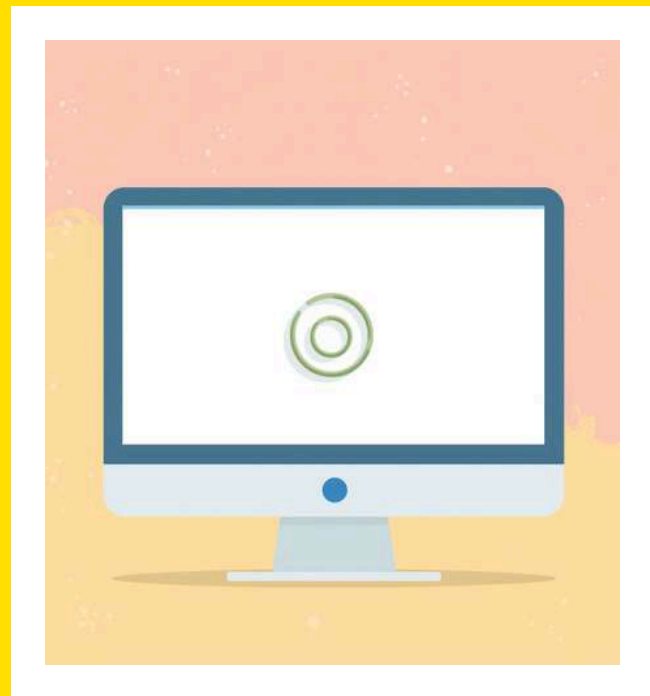

Draw the Spiral Loop

```
for x in range(100):  
    t.pencolor(colors[x % 6])  
    t.forward(x * 2)  
    t.right(59)
```

Loop repeats 100 times • Pen changes color each turn
Turtle moves forward a little more each step
Turtle turns right to create the spiral shape!

• Watch the Spiral Grow!

What Did We Learn?

Importing Modules

We use "import turtle" to tell Python to bring in the Turtle drawing tool before we start coding.

Loops & Colors

We used a "for" loop to repeat drawing 100 times and a colors list to change the pen color each turn!

Making a Turtle

We created a turtle named t using turtle.Turtle() — our magical pen that draws colourful spirals on screen!

Try Your
Own Spiral!

- 🎨 Change the colors in the list!
- ↺ Try turning angles: 60° , 90° , or 45°
- Change how far the turtle moves each time
- 💡 Make it YOUR unique spiral!

Troubleshooting Tips & Help!

Check Your Spelling

Python is very careful about spelling! Make sure every word in your code is spelled correctly.

Indent Your Loop

The lines inside your loop must be indented (moved in) with spaces. Python needs this to work!

Ask a Friend or Teacher

Stuck? Ask your teacher or a classmate for help. Two pairs of eyes are better than one!

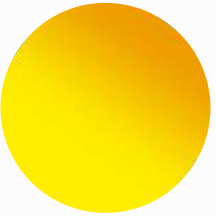

Let's Practice Together!

Can you draw your own colourful spiral today?
Try coding or draw your spiral on paper and share it!

Thank You & Keep Coding!

Great job! Keep exploring with Python Turtle.
You are amazing coders — the journey has just begun!
