

AIR PRESSURE — CAN CRUSH!

**Can NOTHING
Crush This
Bottle?**

Air Is Everywhere and Always Pushing

Air is all around us and pushes from every side. Air pushes the balloon outwards!

What Happens If We Take Air Out?

What do you think will happen if we take air out of a bottle? Make your guess!

The Bottle-Crush Experiment

Materials You Need

- Your lungs
- Empty bottle
- Bottle cap

Follow These Steps

1. Suck air out of the bottle
2. Put on the cap quickly
3. Watch it stay crushed!

The outside air
pushes
and
the

What Did We See?

When we sucked air
out and capped the
bottle, the bottle got
crushed inward!

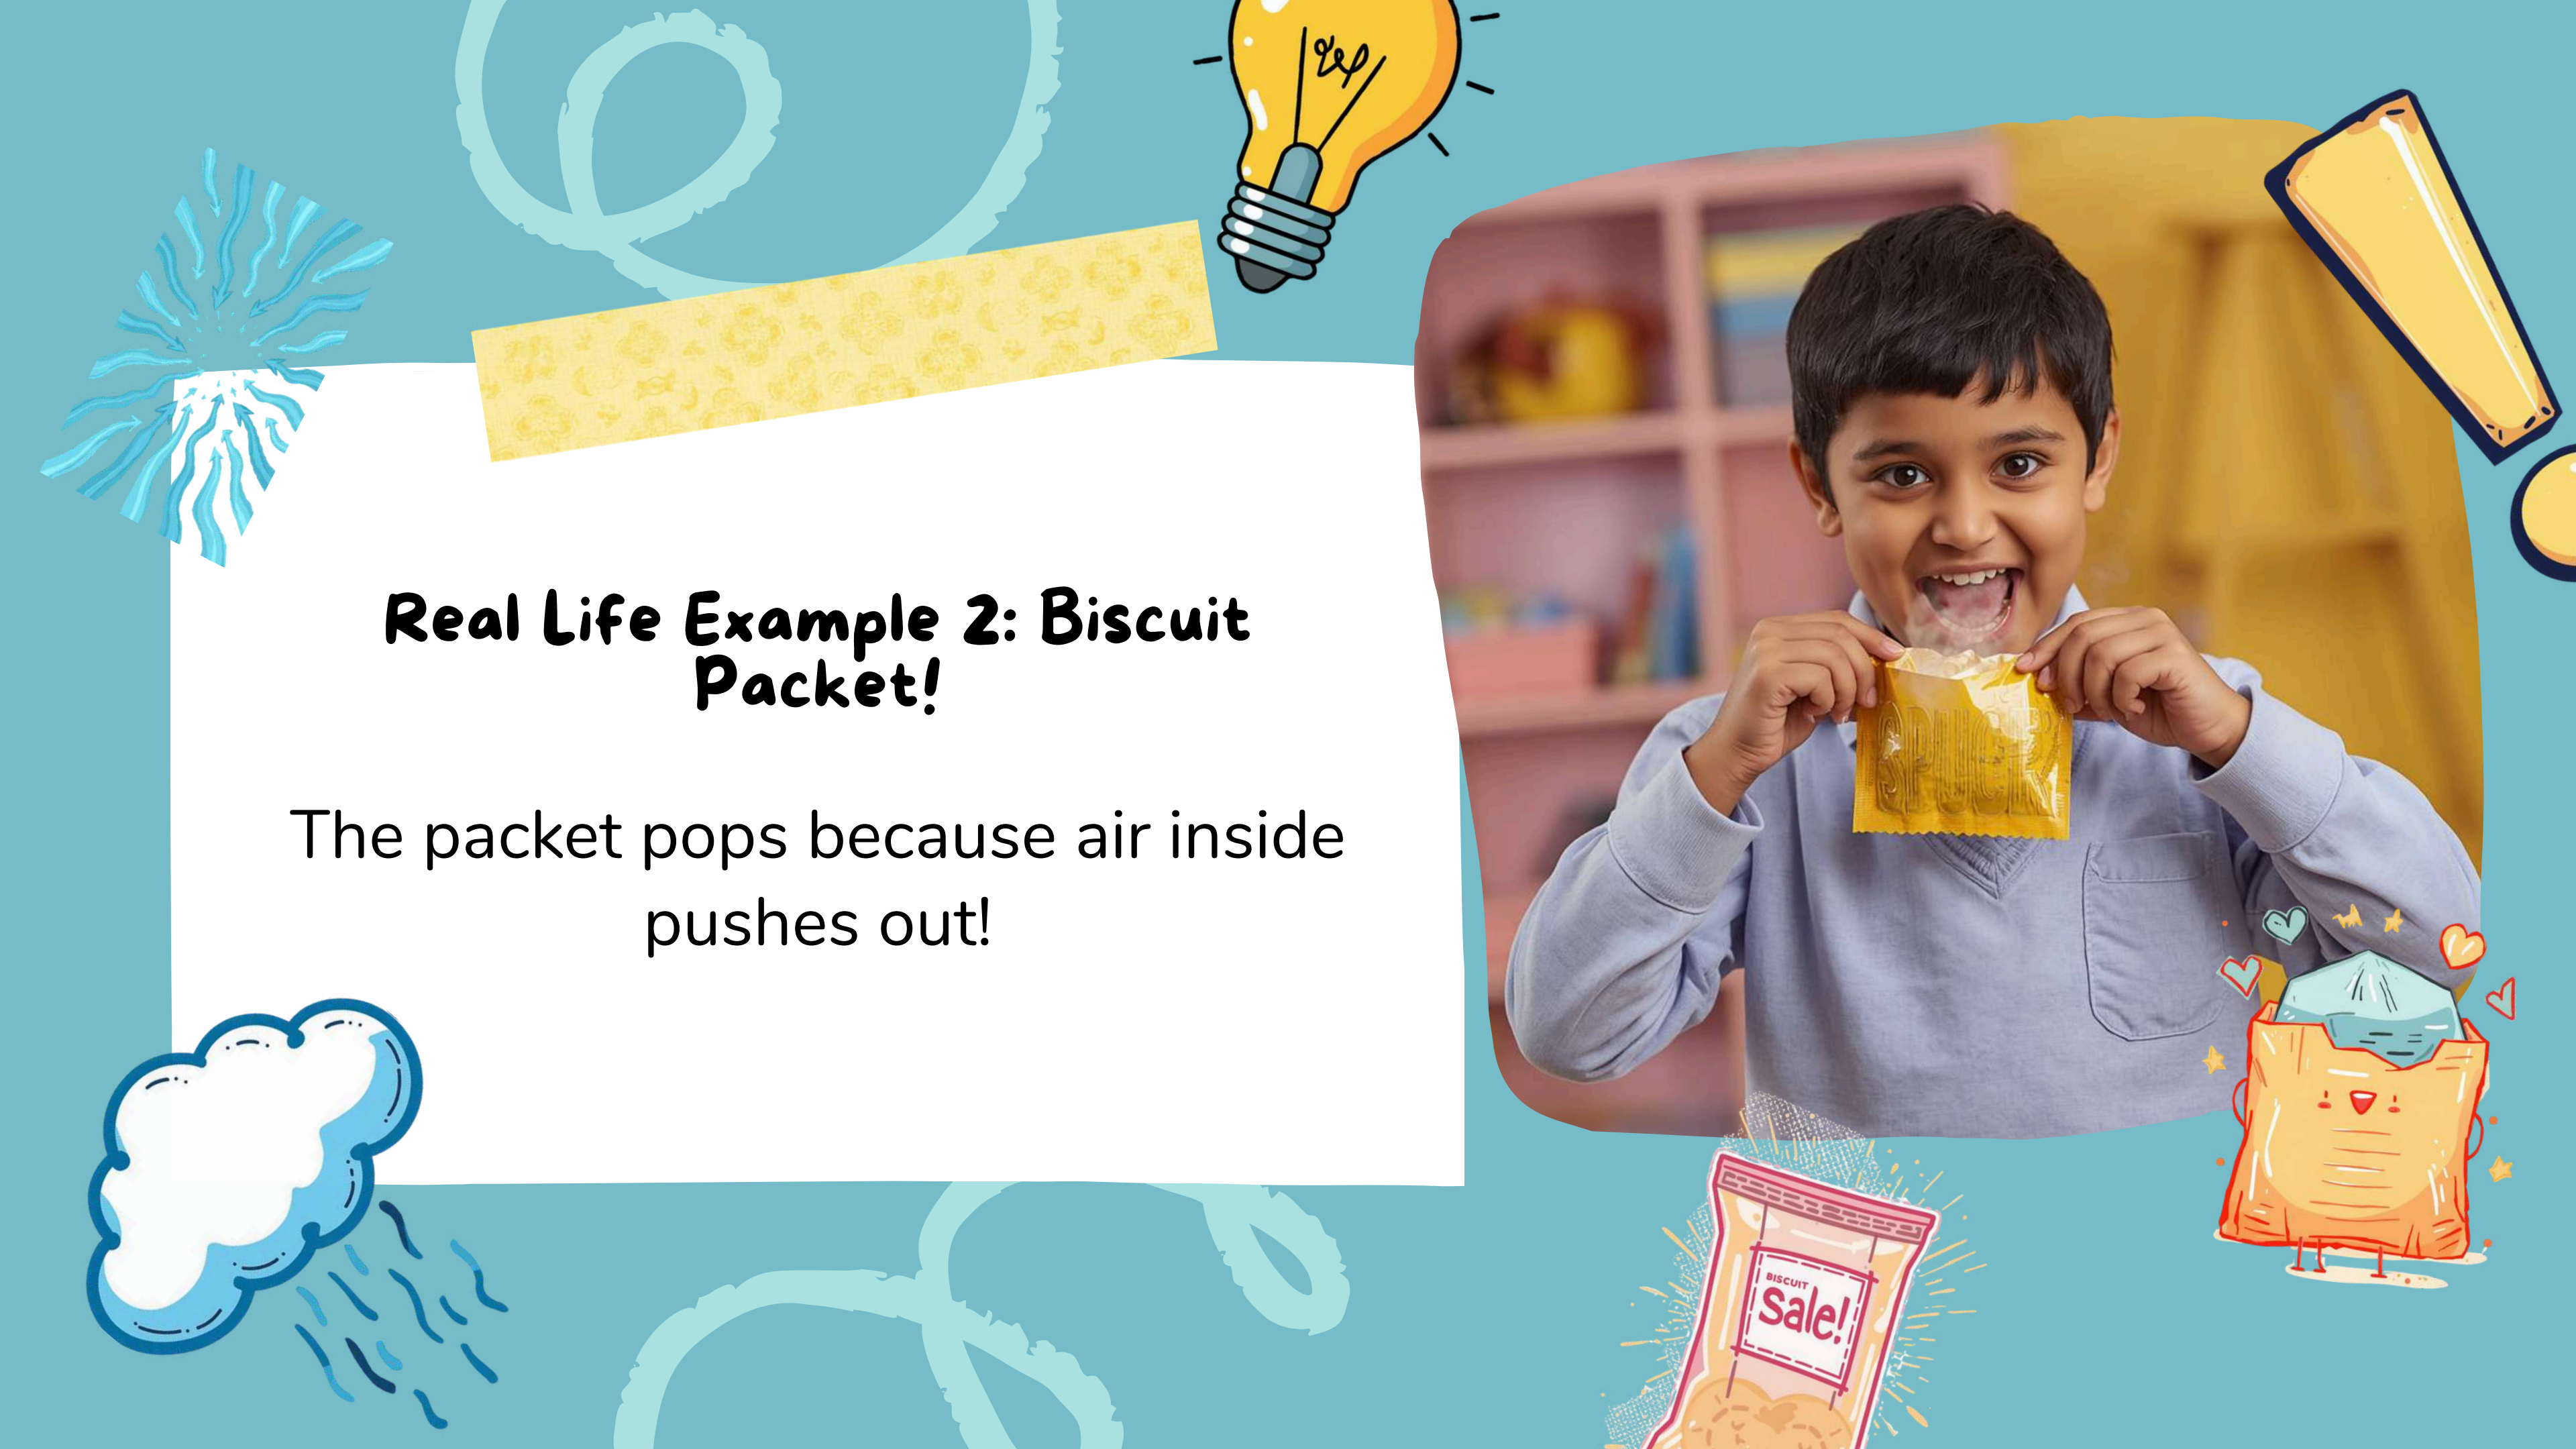

Less air inside = less push
outward.
Outside air pushes harder =
bottle crushes!

Real Life Example 1: Pressure Cooker Whistle

The whistle lets out pressure so food cooks safely.

Real Life Example 2: Biscuit Packet!

The packet pops because air inside pushes out!

Steel Lunch Box

The lunch box stays strong because air pressure inside and outside is balanced (Equilibrium).

Real Life Example 4: Ears Popping on Mountain Trips

Ears pop because pressure changes
when we go up high!

Vocabulary: Important Words to Know

Pressure

Air

Crush

Push = Dhakka (धक्का)

Balance = Santulan (संतुलन)

**You Are a
Science
Detective!**

Great job exploring air pressure
today! Keep watching for our
next lesson to learn more
science secrets.

Thank You!
