

Talking to Computers!

How Does a Chatbot Work? | A Fun Storybook Guide

Meet Dev, Nia, and Chiku! One sunny afternoon, Dev and Nia found a friendly computer robot named **Chiku** on their screen! When Dev types "Hello!", Chiku types back: "Namaste!". How does Chiku know what to say? Let's read along and find out!

☀️ The Puppet Master Behind the Screen

A **chatbot** is a special computer program that can read your words and reply like a helper friend. But it cannot think on its own!

Think of a Puppet Show!

Have you ever seen a wooden Kathputli puppet dance at a mela? The puppet moves and speaks, but it is not alive! A clever human master stands hidden behind the screen, pulling the strings according to a notebook script. A chatbot works exactly like that puppet!

The Magic Three-Tier Tiffin Box!

How does your message turn into a real answer? The chatbot's brain is just like a steel school tiffin box with three layers:

1. The Top Snack Tray (INPUT)

The message or words you type on the keyboard!

2. The Middle Rice Layer (PROCESSING)

The computer matches your words against secret rules made by a human.

3. The Bottom Main Meal Bowl (OUTPUT)

The perfect matching answer that pops up on your glowing screen!

Shop Counter Clues (Key Words)

How does the chatbot know what answer to choose? It acts like an uncle standing behind a sweet shop counter!

- If you say the key word "**Samosa**", he hands you a warm samosa!
- If you say the key word "**Jalebi**", he hands you a sweet jalebi!

Chatbots scan your sentence looking for a matching **Key Word clue**. If a human engineer taught the chatbot the word "Cricket", the chatbot will instantly cheer: "Hooray! Let's hit a sixer!" whenever you type it!

The Confusion Trick (The Barfi Test)

What happens if you type an unexpected word like: *"Give me a square Barfi"*?

Chiku scans the sentence, looks inside its rule notebook, but cannot find the word "Barfi" anywhere! Chiku's digital eyes blink in confusion and it replies: "**I am sorry, I do not understand!**"

 **Important Secret:** Chatbots don't have real brains! They have **Limited Knowledge**. They only know what human programmers teach them—nothing more!

Quick Quiz Time!

Q1. What is a chatbot?

A) A real live magical genie  B) A clever computer program script

Q2. What tier of the tiffin box is the text that YOU type?

 A) The Top Snack Tray (INPUT) B) The Bottom Meal Bowl (OUTPUT)

Q3. Why do chatbots get confused?

A) They are feeling sleepy  B) They haven't been taught that word yet

Fun Take-Home Worksheet

Name: Class: Date:

Part A: Fill in the Blanks

1. Chatbots look for a matching word clue to find an answer.
2. The text answer displayed on your screen is called the layer.
3. A chatbot works like a wooden puppet show.

Part B: Match Chiku's Triggers!

Draw a line or match the typed word to Chiku's correct programmed response:

If you type: "Hello"	 Chiku replies: ("Namaste!" / "Diwali lamps!")
If you type: "Festival"	 Chiku replies: ("Namaste!" / "Diwali lamps!")

Teacher's Answer Key

Quiz Answers: Q1: B | Q2: A | Q3: B

Worksheet Part A: 1. Key / Clue | 2. Output | 3. Kathputli

Worksheet Part B: "Hello"  "Namaste!" | "Festival"  "Diwali lamps!"
