

Solar System Scale Model: A Space Journey

Welcome to Space!

Did you know India reached the Moon and Mars? Our amazing ISRO scientists sent Chandrayaan to the Moon and Mangalyaan to Mars! India is one of the few countries to achieve this incredible feat.

Let's explore our Solar System together! Today we will go on an exciting space adventure to learn about the planets, their sizes, and how far they are from the Sun. Are you ready, young astronauts?

Meet the 8 Planets

Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus,
Neptune!

Remember with: "My teacher (like a mother) teaches
everyone properly"

Why Use Scale Models?

Scientists use models to understand really big things! Our Solar System is so huge that we cannot see it all at once. Models help us see the sizes and distances between planets much better.

Today, we will make our own scale model of the Solar System! Using everyday objects, we can shrink the giant planets and vast distances to fit in our classroom or school ground.

Scale Models with Indian Objects

Let's use everyday objects to understand planet sizes!
Mustard seed = Mercury, Peppercorn = Earth, Laddoo = Jupiter, Cricket ball = Saturn, and a big Kadhai = Sun!

Sun vs Planets: Size Comparison

Let's compare sizes using everyday Indian objects!

-  **Sun = Big Kadhai**
-  **Jupiter = Sweet Laddoo**
-  **Saturn = Cricket Ball**
-  **Earth = Peppercorn**
-  **Mercury = Mustard Seed**

The Solar System is Mostly Space!

- Did you know? Planets are very far apart from each other! The space between them is so vast that if you could drive a car to the Sun, it would take over 170 years!
- Most of our Solar System is empty space! If planets were seeds, the space between them would be like a whole playground. That's why scale models help us understand.
- We use meters to measure distances in our model. 1 AU (the distance from Sun to Earth) = 1 meter in our school ground model. This helps us understand the huge distances!

Let's Walk the Distances!

Mercury: 0.4 m from Sun
Earth: 1 m from Sun
Jupiter: 5.2 m from Sun
Neptune: 30 m from Sun

Go to your school ground and measure these distances! Start at the Sun and walk to each planet. Feel how far apart they really are!

See How Far Planets Are!

- Kids are measuring and placing planet markers on the school ground. Feel the empty space as you walk between each planet!
- Watch how far apart the planets really are! When we walk from Mercury to Neptune, we truly understand the vastness of space.
- Caption: "The Solar System is huge!" Walking these distances helps us feel just how much empty space exists between planets.

Now, Your Turn: Hands-On Activity

Use Household Items for Planets

- Mustard seed = Mercury
- Peppercorn = Earth
- Laddoo = Jupiter
- Cricket ball = Saturn

Mark Distances with String or Tape

Follow Our Size & Distance Scales

- Use the measurements we learned today
- 1 meter = 1 AU in your model

Share Your Model!

- Show friends and family your Solar System

Quick Recap: What We Learned

- 🪐 *Planets are in order from the Sun — Mercury is closest, Neptune is farthest!*
- 📏 *Scale models help us understand the huge sizes and distances in space.*
- ✨ *Space is mostly empty — planets are tiny dots in a vast universe!*

Pop Quiz Time!

Question 1:

Which planet is closest to the Sun?

Question 2:

What object represents Earth in our scale model?

Question 3:

How far is Jupiter from the Sun in our school ground model?

Think carefully and raise your hand when you know the answer!

ISRO's Amazing Missions

India has achieved incredible space milestones! Chandrayaan-1 reached the Moon in 2008, Mangalyaan orbited Mars in 2013, Chandrayaan-3 landed on the Moon in 2023, and Aditya-L1 is studying our Sun!

ISRO Inspires Us!

- "Reach for the stars, like ISRO!"
- India's space agency has shown us that with hard work and dreams, we can achieve anything amazing!
- From launching rockets to reaching the Moon and Mars, ISRO proves that Indian scientists are among the best in the world. You too can be a space explorer one day!

Planet Sizes Recap

Planet Distances Recap

Mercury: 0.4 m from Sun

Earth: 1 m from Sun

Jupiter: 5.2 m from Sun

Neptune: 30 m from Sun

Remember: Our scale model is much smaller than the real Solar System distances!

Fun Facts About Planets

Mars is called the Red Planet because of its rusty red color!
Saturn has beautiful rings made of ice and rock that sparkle in space!

Earth is our home planet - the only one with water and life!
Jupiter is the biggest planet - over 1,000 Earths could fit inside it!

Thank You & Keep Exploring!

- Thank you for joining our space journey! We hope you had fun learning about our amazing Solar System and how to make scale models. Remember, the universe is full of wonders waiting to be discovered!
- Keep looking up and dreaming big! Who knows, maybe one day you'll be an astronaut or scientist at ISRO! 🚀★
