

My Magic Weather App!

A Fun Coding Adventure with HTML

Name: _____ | Grade 1 Workbook

1. Aanya's Magic Window

Meet Aanya! Aanya loves looking out of her bedroom window. Some days the sun shines bright, and some days big grey clouds splash water everywhere!

"I wish I could build my own magic window on my computer!" Aanya said. "A window that changes the weather whenever I want!"

Guess what? You can build one too! Today, we are going to become young computer coders. We will use a special computer language called HTML to create our very own Weather App!

2. The Steel Tiffin Box

How does a computer web page hold things? It works just like your favorite Steel Tiffin Box from home!

My HTML Tiffin Box

A tiffin box has different sections or compartments. Each section holds a special treat neat and organized:

 **Top Section: Holds your yummy Rice!**

 **Middle Section: Holds your tasty Sabzi!**

 **Side Section: Holds your warm Dal!**

In HTML, we use things called **tags** as our compartments! They keep our text and pictures in their own special place so they don't mix up.

3. The Big Bold Title Tag

When you want to write a big title for your weather app, you use a special container tag called `<h1>`!

The `<h1>` tag makes your text **BIG, BOLD, and IMPORTANT!** It tells everyone: "Look at me first!"

The Newspaper Headline Rule

Think of the huge headlines on the front page of newspapers like *Dainik Jagran* or *The Times of India*. They are the very first thing your eyes see!

SUPER SUNNY DAY!

Your `<h1>` tag does the exact same magic on your web page!

4. The Magic Picture Tag

A web page without pictures would be boring, right? To add photos to our app, we use the magic `<img>` tag!

Your Digital Scrapbook

Think about your favorite scrapbook at home. You use glue to paste photos of juicy mangoes, big friendly elephants, or a fun trip to the zoo!

The `<img>` tag works exactly like that sticky glue. It takes a picture and pastes it right onto your digital web canvas!

We can swap the pictures anytime to change our application's weather!

5. Sunny Day Fun!

Let's visit different cities in India to see how the weather changes!

Hot Sunny Chennai Afternoon

When the big golden sun shines bright in Chennai, it gets very, very hot! Our throats feel dry and the weather makes us super thirsty!

What do we do? We drink a tall, cold glass of yummy Buttermilk (Mausam treat) to cool right down!

To show this on our app, we tell our code to use a sunny text title and a bright sun picture!

6. Rainy Day Treats!

Now let's zoom over to another beautiful city to see a totally different kind of weather!

Rainy Mumbai Evening

When dark clouds roll into Mumbai and bring cool rain and loud rolling thunder, everything changes!

What do we do? We stay safe and cozy inside our homes with our family, listening to the patter of the rain (Baarish). And we eat delicious, hot, crunchy Pakoras!

Different weather means different treats! We can change our HTML page to match this rainy mood perfectly.

7. Let's Look at Our Code!

Look how clean and simple our magic code is! We don't need any long or scary setup codes. Just our friendly tiffin boxes:

```
<h1>My Chennai Weather App</h1>  

```

When the computer reads this, it instantly displays a big beautiful title saying "My Chennai Weather App" and pastes a lovely warm picture of the sun right underneath it!

8. Quick Fun Quiz!

Let's check our super coder powers! Circle the correct answer:

Question 1: Which tag makes your text look BIG, BOLD, and IMPORTANT like a newspaper headline?

- A) tag
- B) <h1> tag

Question 2: What is an HTML tag like?

- A) A compartment in a steel tiffin box
- B) A cold glass of buttermilk

 **Congratulations, Super Coder!** 

You completed your first HTML weather app workbook!
