

SINK OR FLOAT? LET'S FIND OUT!

Density Intro

INTRODUCTION

What happens when we put things in water?
Some things go down to the bottom, and some
things stay up at the top!
Today we will discover why this happens and have
lots of fun exploring together!

1ST CONCEPT

What is Sinking?

When something is heavy for its size, it goes down to the bottom of the water. We call this sinking! Heavy things like rocks and coins sink because they are dense.

Heavy for size?
Down it goes!

2ND FLOAT

What Does Floating Mean?

When something floats, it stays on top of the water! Objects that are light for their size don't sink down. They rest gently on the surface, like a leaf on a pond.

Light for size = floats!

3RD CONCEPT

Things That Sink

Some objects are heavy for their size!
Rocks, coins, keys, and marbles all sink to
the bottom of the water.

They're too dense to float!

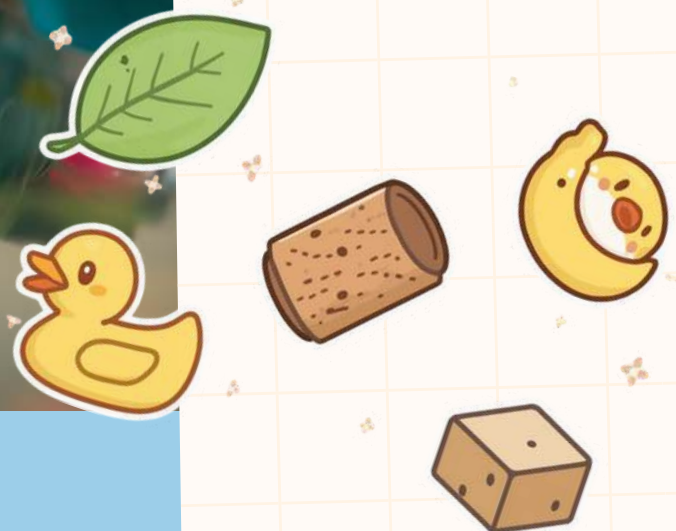

4TH FACT

Things That Float!

Some things are light for their size! Leaves, corks, plastic toys, and wooden blocks all float on water because they are less dense.

Light for size = floats!

5TH STEP

Let's Try It!

Get a bowl of water and collect different objects from around you. Before putting each object in water, guess – will it sink or float? Then test it and see if you were right!

Guess first, then test!

BIG WORD ALERT: DENSITY!

It means how much stuff is
packed inside something!

GREAT JOB SCIENTISTS!

Keep exploring what sinks and floats at home!
