

Multiplication Intro

Session 1: What Does Multiplication Mean?

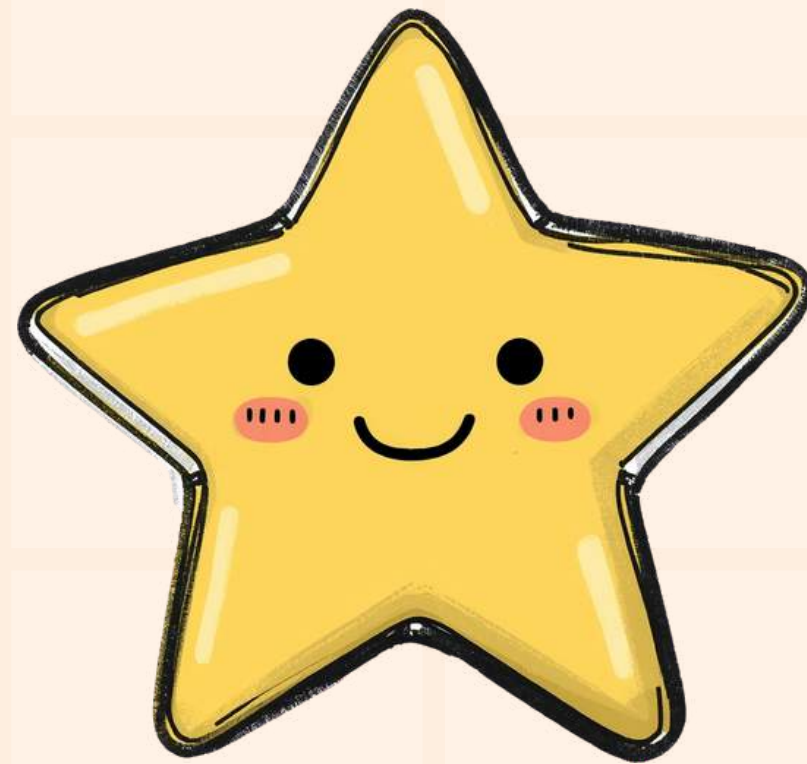

**Can you count how
many laddoos?
Is there a FASTER way?**

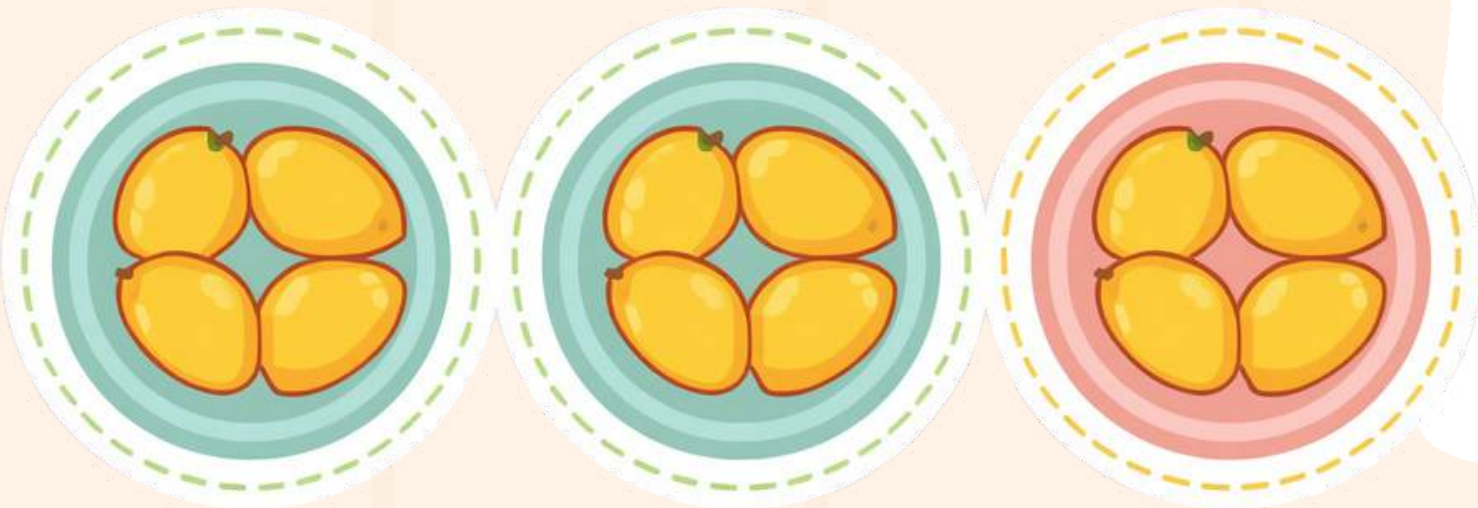

Today we learn the superpower of maths –
MULTIPLICATION!

Equal Groups: Mangoes in Bowls

Here are 3 groups of 4 mangoes each. Can you see how the mangoes are arranged in equal groups? Let's count together with Riya and Aarav!

What Are Equal Groups?

Let's understand how multiplication works by looking at equal groups. When we put equal groups together, we can count faster!

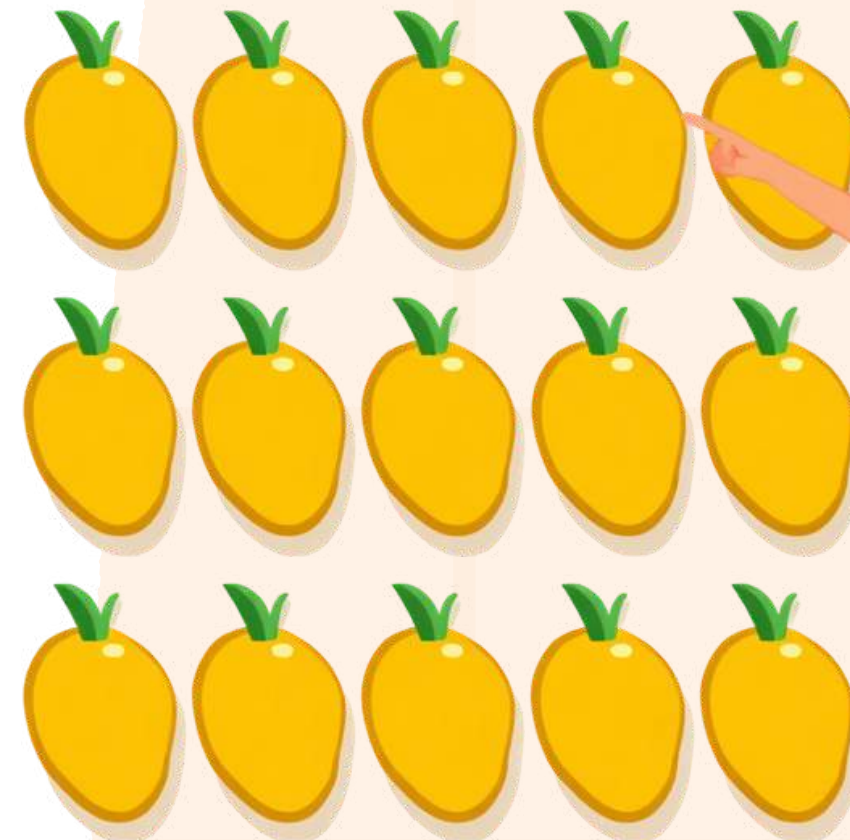

Multiplication means putting equal groups together

3 groups of 4 means 3 times 4 mangoes

We write it as: $3 \times 4 = 12$

Repeated Addition Example

Adding 4 three times is the same as 3 times 4. It's a faster way to count equal groups!

$$4 + 4 + 4 = 12$$

$$3 \times 4 = 12$$

Same answer – FASTER!

More Indian Examples

Multiplication helps us count quickly! Let's see how we can use it with yummy Indian treats.

3 boxes of laddoos, 4 in each $\rightarrow 3 \times 4 = 12$

2 idli tiffins, 5 idlis each $\rightarrow 2 \times 5 = 10$

Counting is faster with multiplication!

Multiplication Sentence: The TIMES Star

Let's learn how to read and write multiplication! The $\times$ symbol is called the TIMES star. It helps us write equal groups in a short, fast way.

3 = number of groups

$\times$ = "times" or "groups of"
(TIMES star!)

4 = number in each group, 12 =
total

$$\begin{array}{r} 3 + 4 \\ = \\ 12 \end{array}$$

Reading Multiplication Sentences

Let's practice reading multiplication! Look at the example below and read it aloud with confidence.

$2 \times 5 = 10$ means "Two times five equals ten"

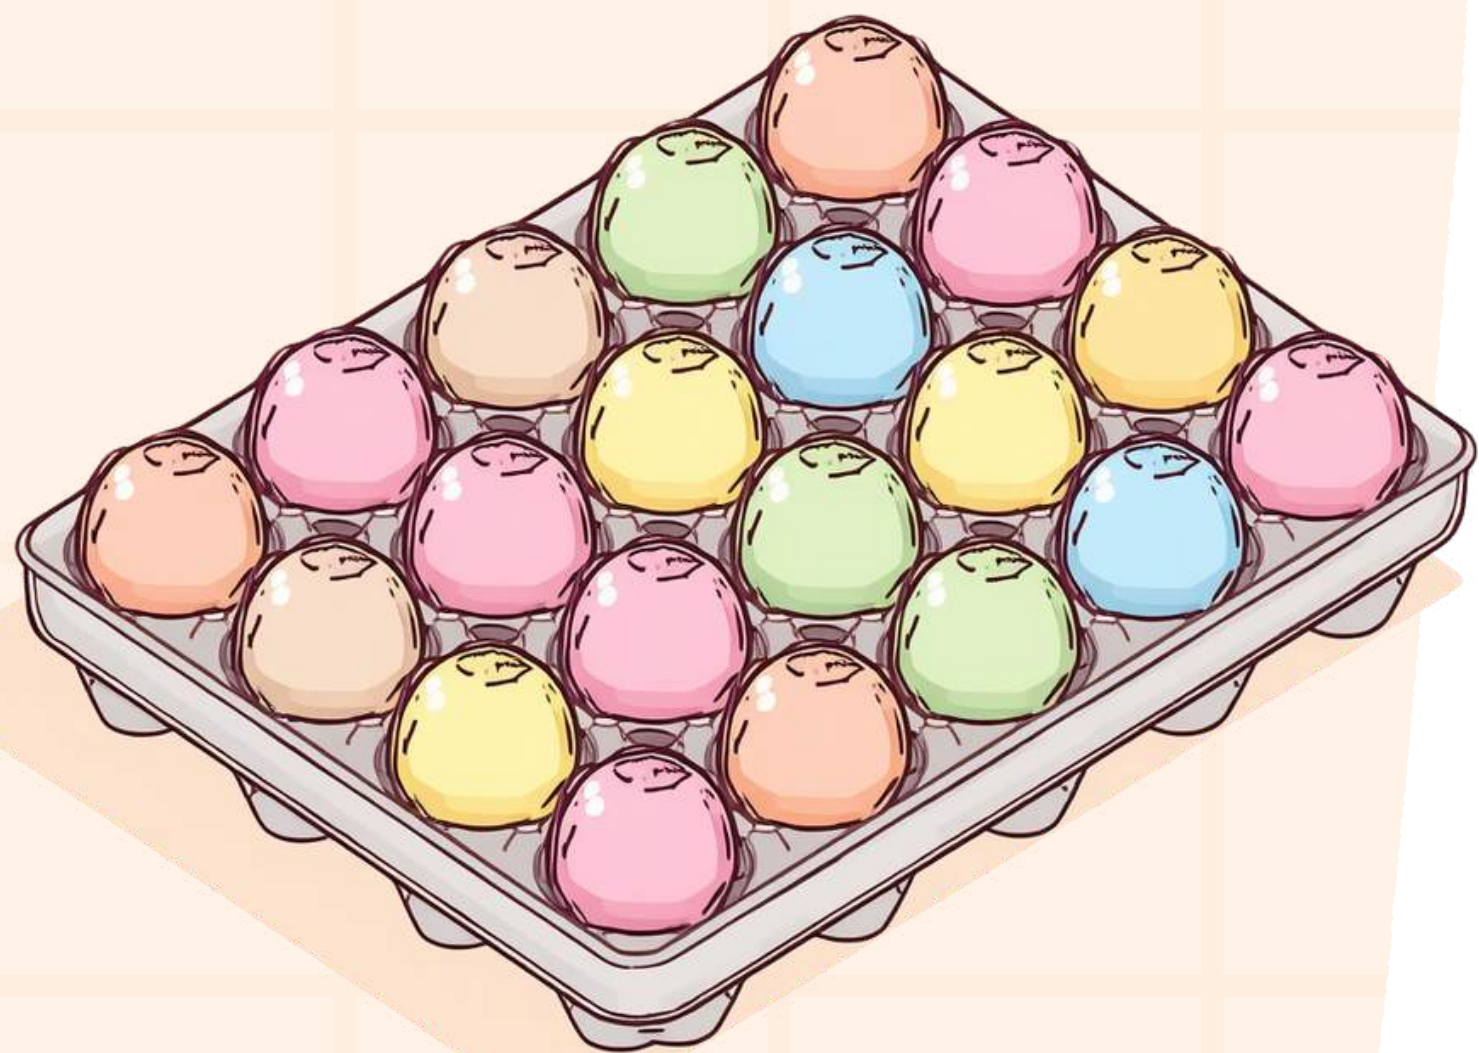

Read aloud with me: Two times five equals ten!

You're doing great! Keep practicing!

Arrays: Rows and Columns

4 rows with 5 in each row = $4 \times 5 = 20$

Rows go across, columns go down. Arrays help us see multiplication!

Arrays and Commutative Property

Multiplication works BOTH ways! The order doesn't change the answer. Rows and columns can switch!

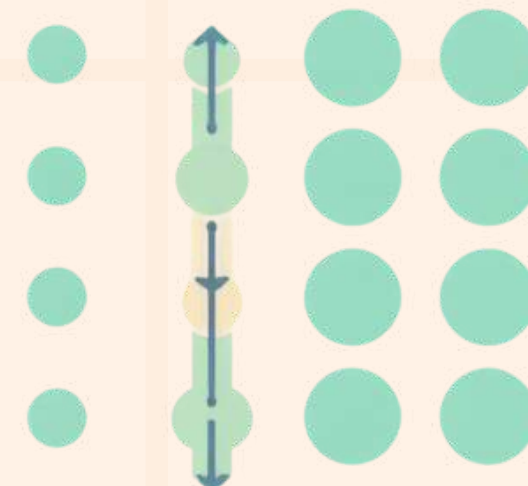

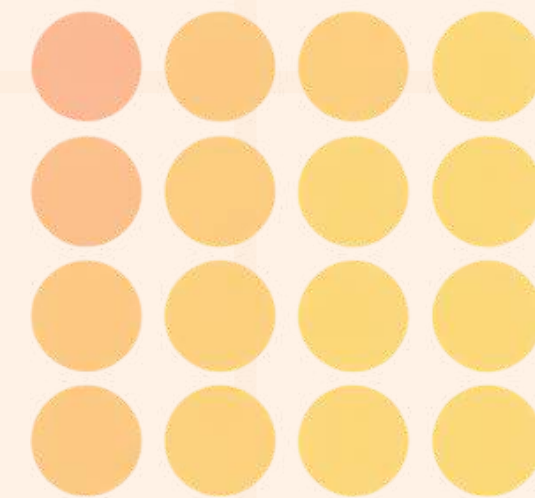

$$4 \times 5 = 20 \text{ (4 rows of 5)}$$

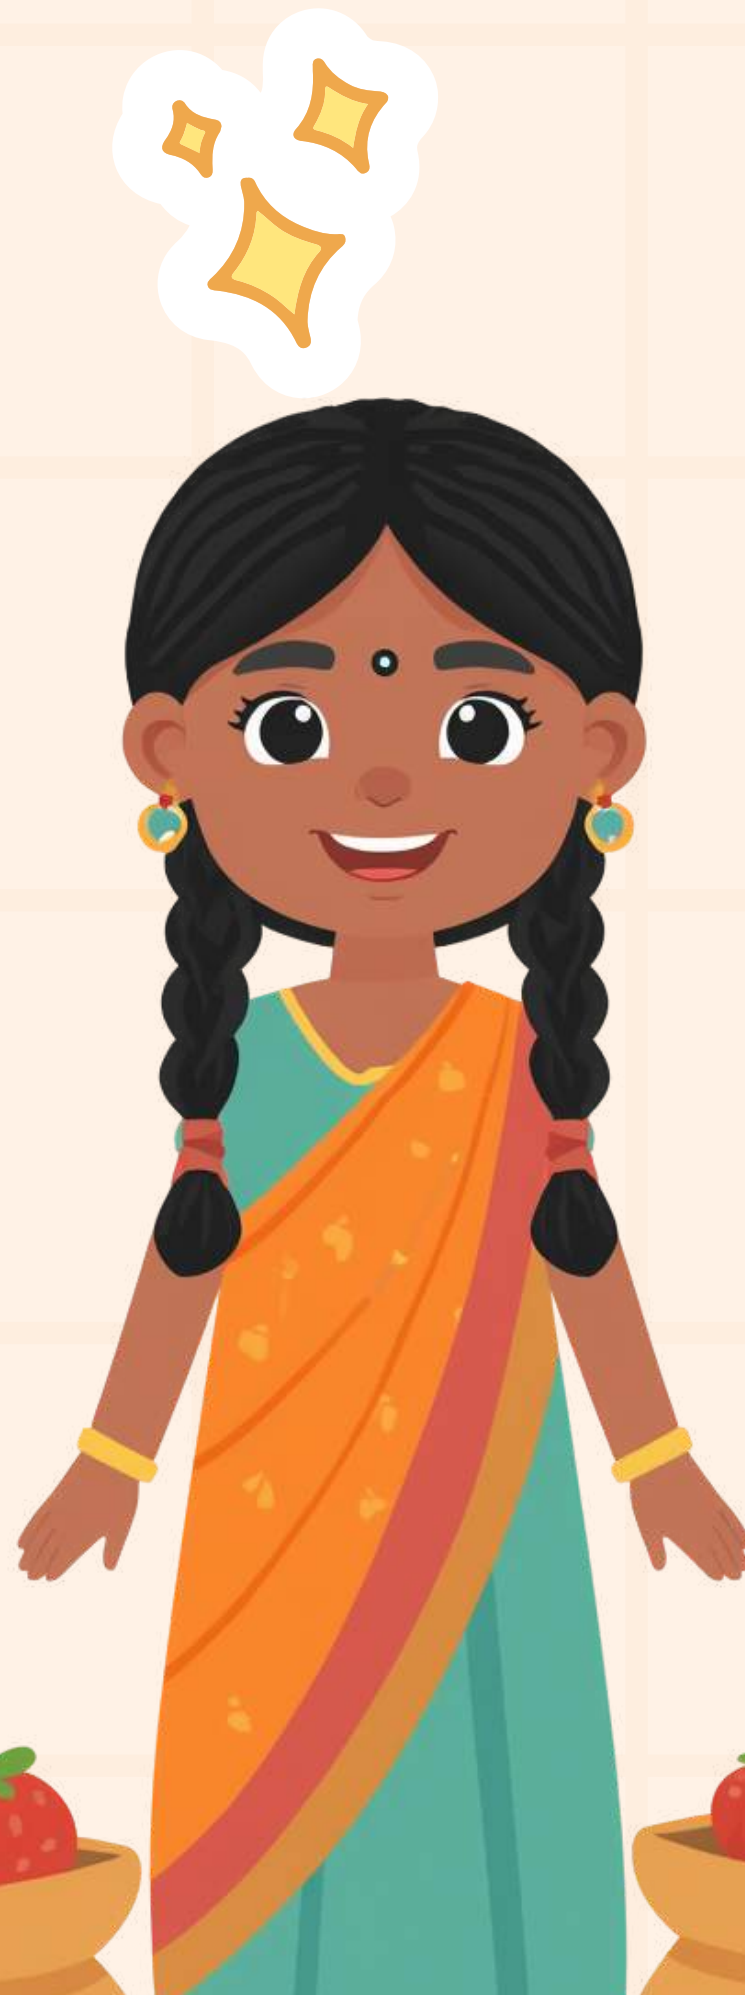

$$5 \times 4 = 20 \text{ (5 rows of 4)}$$

Same total, different arrangement!

Worked Examples in Indian Context

Let's practice multiplication with our friends Priya, Rohan, and Meera!
Watch how they use multiplication in everyday situations.

Priya: $2 \text{ bags} \times 3 \text{ tomatoes} = 6$

Rohan: $4 \text{ teams} \times 5 \text{ students} = 20$

Meera: $5+5+5 = 3 \times 5 = 15$

Practice Questions

Let's test what you've learned! Answer these questions out loud.
You can do it!

Q1: 3×2 means:
a) $3+2$ b) 3 groups of 2 c) $3-2$

Q2: $2 + 2 + 2 + 2 = ___ \times ___$

Q3: Look at the jars! Write the multiplication sentence.

Recap & Summary

Let's remember what we learned today about multiplication! You did amazing work understanding equal groups and arrays.

Multiplication = equal groups put together

Faster way to add the same number

Write as: [groups] $\times$ [in each] = [total]

Fun Challenge at Home!

Look around your home! Can you spot equal groups? Find them everywhere and tell your family your multiplication sentence!

Biscuits in a packet

Windows in a building

Bangles in a box

Multiplication Star – Session 1 Complete!

Great job! You learned the superpower of
multiplication today. See you next time!
