

Your Magic Report Card Helper

Meet Kabir's Big Problem

- Kabir's teacher, Ms. Sharma, is buried under 40 paper report cards! She looks so tired and stressed. There must be a better way...
- Can we help make a magic digital helper? Kabir thinks so! 💡 What if a computer could do all the hard work for Ms. Sharma?

What is a Variable? The Magic Box!

- Imagine a box with a label to keep your things safe! A variable is just like that — a labeled box that holds something for you.
- `student_name = "Aarav"`
- `maths_marks = 98`
- Just like your lunch box is labeled "Paneer Paratha" or "Apple Slices" — Python uses variable names to remember your data!
- The label = the variable name
- What's inside = the value stored

Your School Locker Holds Your Stuff!

- Just like your locker or lunch box holds your things safely, variables hold your names and numbers in Python!
- `student_name = "Aarav"`
- `maths_marks = 98`
- Each variable is like a labeled box — easy to find, easy to open!

What is print()? The Loudspeaker!

- print() is like the Principal's microphone that tells everyone what's inside the boxes!
- print("Aarav got an A+ Grade!")
- The print() function SHOWS your message on screen — loud and clear!
- Think of it this way:
-  Variable = the box that holds the message
-  print() = the loudspeaker that announces it!
- Commas in print() are like kids joining hands — they connect words and numbers together!

Let's Build a Digital Report Card!

Step 1: Store a student's name in a variable!

```
name = "Diya"
```

The box is labeled name and holds the value "Diya" inside it. Easy, right?

- Try it yourself! Drag and drop a new name into the box below. What happens when you change "Diya" to your own name? The variable updates instantly — like writing a new name on your label!

Let's Add Marks!

Step 2: Store the marks in a variable!

marks = 95

Here, marks is the magic box label, and 95 is what goes inside!

- 🎯 Try it! Drag the number 95 into the marks box below.
- What if Diya scored 100? Change 95 to 100 and see what happens!

Show the Result Loud & Clear!

Step 3 — Use `print()` to show the result!

```
print(name, "scored", marks)
```

💬 Output: "Diya scored 95"

`print()` joins `name` + `"scored"` + `marks` using commas — like holding hands! 

- 🧠 Quick Check! What will print if `marks = 90`?
- A) Diya scored 95
- B) Diya scored 90 
- C) marks scored name
- Change the value → the output changes too! Magic! ✨

Nothing

Try Changing the Values!

Change the name or marks and see what happens!

```
name = "Diya"
```

```
marks = 95
```

```
print(name, "scored", marks)
```

Now try: `name = "Aarav", marks = 88`

What does Python print now?

Just like Ms. Sharma re-checks an exam paper and adds marks, you can update a variable anytime!

Every time you change the value inside the box, Python uses the NEW value. The magic box always remembers the latest thing you put inside it!

Real-World Magic!

- Your school's online portal uses the same magic boxes and loudspeakers to show your report card on a screen!
- Every time you see your marks online, Python-style variables and `print()` are working behind the scenes. The same code you just learned powers real school apps!

Quick Quiz Time!

Q1: What is a variable?

- ☐ A box that holds things
- ☐ A loudspeaker

Q2: What does print() do?

- ☐ Stores data
- ☐ Shows messages

Q3: What happens if you change a variable value?

- ☐ The box updates with new info
- ☐ The message disappears

Think carefully — you know this!

Two Superpowers of Python Code

🧠 Variables = Magic Boxes

Variables store your names and marks — just like a labelled lunch box holds your food!

```
student_name = "Aarav"
```

```
maths_marks = 98
```

📢 print() = Loudspeaker

print() shows what is inside the boxes — like the Principal's microphone at assembly!

You can now build your own digital report card!

Take-Home Challenge!

- Try making your own report card at home! Change the name and marks variables and run your code. See what happens when you update the values!
- Show your family your magic digital report card. You are already a Python coder! Keep experimenting and have fun with your new superpower!
