

PYTHON NUMBER GUESSING GAME

LET'S CODE & PLAY!

WELCOME TO OUR CODING ADVENTURE!

HELLO, YOUNG CODERS!

Today, we'll learn how to create a
fun guessing game using Python!
Get ready to think, create, and have
a blast with code. Are you excited?
Let's go! 🚀

VARIABLES!

Variables are like steel containers labeled with names — we keep sweets like ladoos and barfis inside! Each container stores information for us.

Each container has a name (label) so we know what's inside — just like a variable has a name to store information!

**3 Types
OF DATA!**

TAKING INPUT!

input() is like the golgappa vendor asking, "What will you have?" — we tell the computer our guess!

🍡 guess = input("Guess a number: ")

Just like you place your order, input() lets the computer listen to YOU!

IF / ELSE DECISIONS!

> GULLY CRICKET UMPIRE

🏏 IF the ball hits the wicket → OUT! (if condition is TRUE)

🙌 ELSE → Not Out! (else condition)

Just like an umpire decides OUT or NOT OUT, if/else helps the computer make decisions!

```
if guess == secret_number:
```

```
    print("Correct! You win!")
```

```
else:
```

```
    print("Try again!")
```

INDENTATION

CODE INDENTATION — LIKE STEPPING INSIDE A METRO COACH!

Indentation means staying inside the coach when you step in. Code inside if/else needs to be 'inside' too!

- Step inside the metro = step inside the if/else block
- Neatly aligned code = neatly aligned passengers
- Indentation tells the computer which code belongs where!

OUR 5-LINE CODE!

```
secret_number = 5
guess = int(input("Guess a number: "))
if guess == secret_number:
    print("Correct! You win a laddoo!")
else:
    print("Wrong guess! Try again!")
```

 Line 1: Store the secret!

 Line 2: Ask for your guess!

 Line 3-4: Check if correct!

 Line 5-6: Oops, try again!

**CODE
TIME!**

BUG HUNTING TIME!

Uh-oh! Sometimes code has bugs. Let's find and fix them! Here are 3 common mistakes to watch out for:

FORGETTING INDENTATION INSIDE IF/ELSE

MISSPELLING PRINT OR MISSING COLON :

MAKE YOUR GAME UNIQUE!

Change the secret number to make it harder or easier!

Use fun messages like "Well done, champ!" or "Try again!"

Add points or rewards for every correct guess!

Let your friends play and take turns guessing!

FUN IDEAS!

PRACTICE & RECAP

Great job today! Here's what we learned:

- Variables store information (like sweet boxes!)
- `input()` takes guesses from the player
- `if/else` makes decisions in our code
- Indentation tells the computer what belongs where
- Small code can make super fun games!

YOU BUILT A REAL PYTHON GAME TODAY!

**KEEP PRACTICING — EVERY CODER
STARTED HERE!**

YOU EARNED YOUR CODING BADGE!

CONGRATULATIONS, CODER!

You've built your very first Python game — the Number Guessing Game! That's a huge achievement. You used variables, `input()`, `if/else`, and indentation like a real programmer!

Share your coding badge with your family and friends. Keep practicing and keep coding — the next big app could be yours! 🚀
