

HOW DO WE SEE? THE MAGIC OF OUR EYES!

Let's Discover Together!

IMAGINE A POWER CUT!

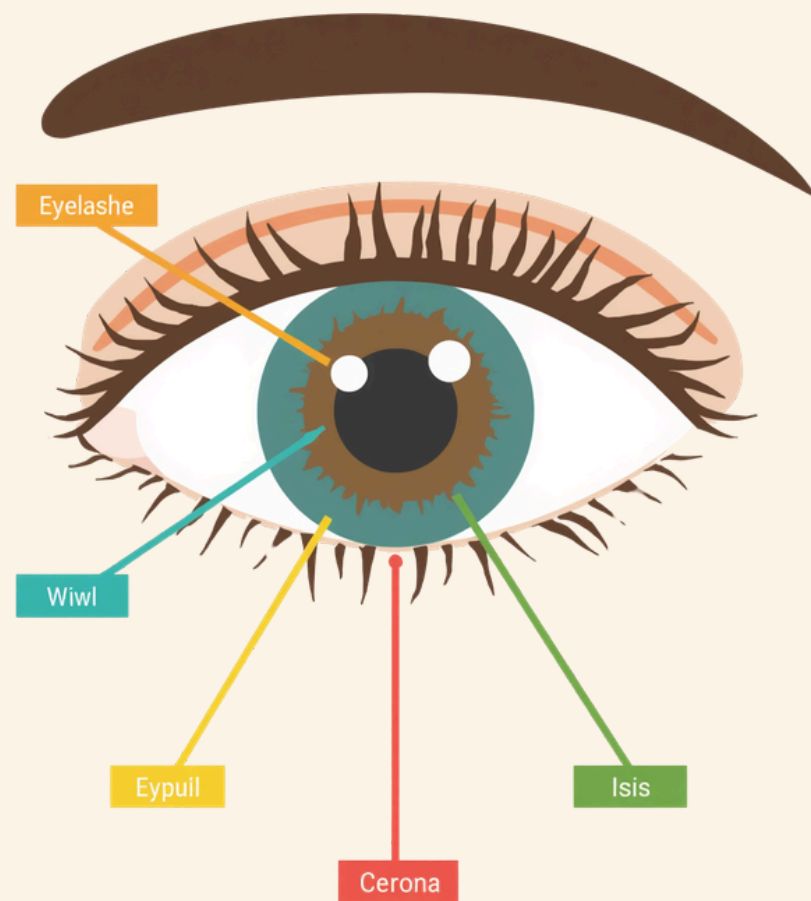

Close your eyes... Can you see your cricket bat or doll in the dark?

Think about it — why can't we see anything without light? Let's find out together!

Look Into Your Magical Camera — Your Eye!

Eyelashes: Keep dust away like a net

Eyelid: Opens and closes like curtains

Pupil: The doorway that lets light in

Iris: Colorful ring that controls the doorway size

Cornea: Clear cover that protects the eye

Activity: Hold a mirror and look closely at your own eye!
Can you spot all the parts? Each part has a special job
— just like parts of a camera!

Shields That Protect Your Eyes!

Eyelashes catch dust like a net

Eyelids close quickly like curtains

Blink fast to keep dirt out!

Try it: gently touch your eyelashes!

Now blink quickly — feel the curtain close!

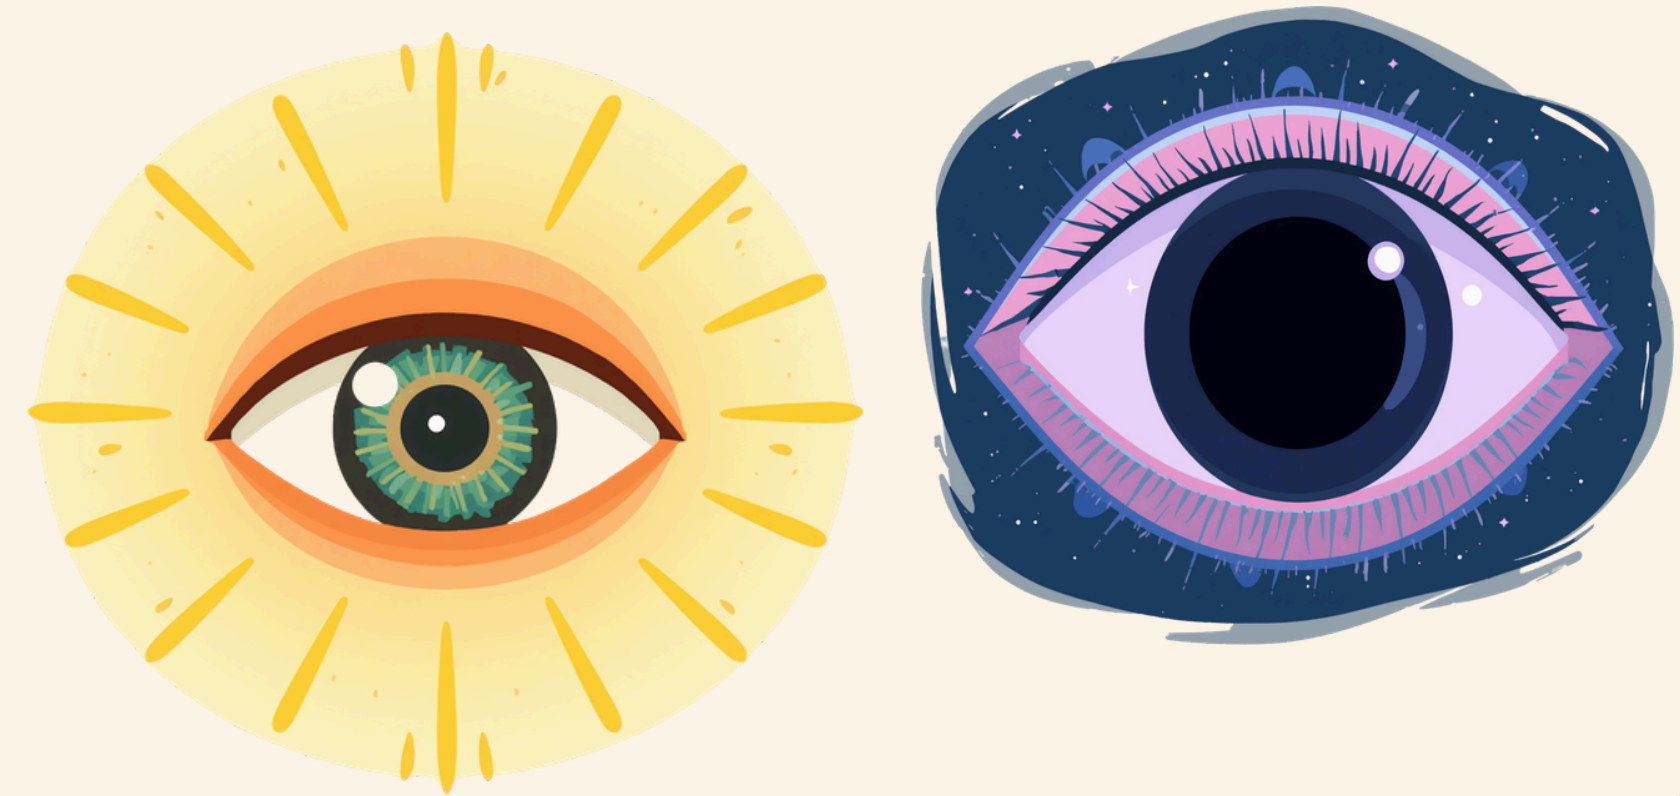

The Pupil Opens and Closes Like a Window!

Your pupil is a magical doorway for light!

In bright light (like Uttarayan terrace!) — pupil gets TINY to block extra light.

In a dark room — pupil grows BIG to let in more light!

☀️ Activity: Make a circle with your finger. Make it small like bright sun, then big like a dark room!

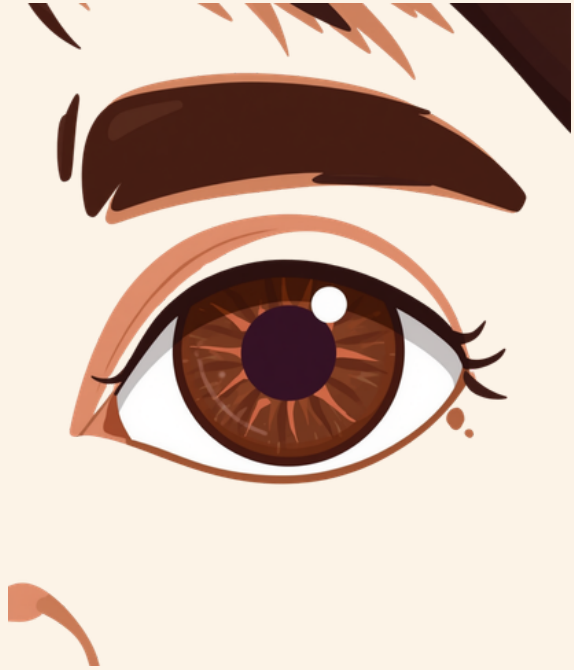

From Bright Terrace to Dark Room!

Imagine flying kites on a sunny Uttarayan terrace — then walking inside a dark room!

Your pupil adjusts like magic to help you see clearly everywhere.

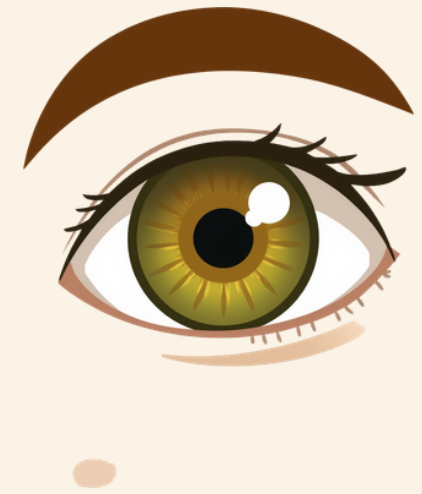

No light? Pupil opens wide!

Too much light? Pupil gets tiny!

The Iris – The Colorful Window Frame

The iris is the colorful ring around the pupil. It helps open and close the pupil doorway perfectly – and every eye is beautifully unique!

Aarav has dark brown eyes – the most common in India!

Diya has hazel eyes – a beautiful mix of brown and green!

Ananya's iris widens her pupil in dim light to see better!

Kabir's iris controls how much light enters his eye!

Every iris has a unique pattern – like a fingerprint!

All eye colors are special – diversity makes us wonderful!

LIGHT BRINGS US THE WORLD!

We see because light bounces off things and comes into our eyes. No light... no seeing!

On dark monsoon nights, even with eyes wide open, we can't see without light. Light is our messenger!

Our Eyes Adjust Like Magic!

☀️ Bright Terrace (Uttarayan Kite Flying)

Pupil gets SMALL to block extra light!

🌙 Dim Indoor Room

Pupil gets BIG to let in more light!

Our eyes change automatically — like magic! ✨

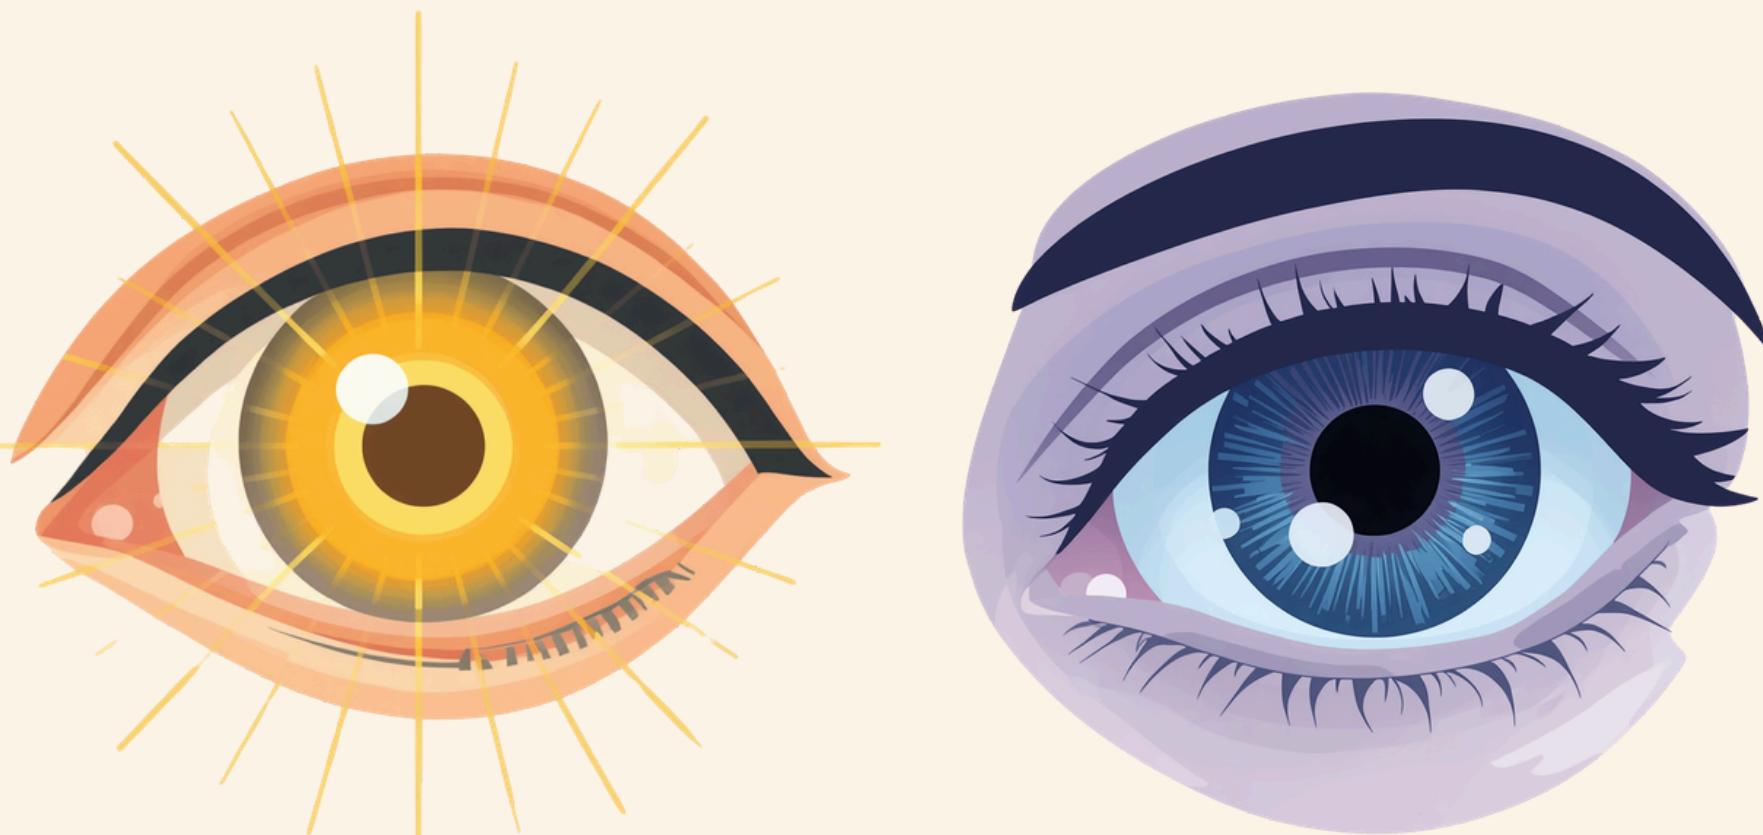

Try It Yourself! Finger Activity

Use your fingers to make a circle.

👉 Make it TINY — like your pupil in bright sunlight!

👉 Make it BIG — like your pupil in a dark room!

The pupil changes size to let in just the right amount of light so we can always see clearly! ✨

Keep Your Magical Cameras Safe!

Wash your eyes with clean, cool water

Keep one arm's distance from your phone

Never look directly at the bright sun

Blink often and take screen breaks!

Let's play Green Light / Red Light!

Green Light or Red Light? Eye Health Quiz

Look at each situation below. Raise your hand for

- Green Light (safe!) or
- Red Light (not safe!).

Let's see who knows best!

● Reading a comic book under a dim 0-watt bulb at night

● Looking directly at the afternoon sun during Holi celebrations

Raise your hand — Green Light ● or Red Light ●?

● Washing eyes with clean, cool water after playing outside

● Keeping one-arm distance from smartphone while doing homework

Remember: Good habits keep your magical cameras safe! 🧐

What Did We Learn Today?

Eyes are like magical cameras!

Eyelashes and eyelids protect our eyes

Pupil and iris control light for perfect vision

We must keep our eyes safe always

Light helps us see the world around us!

Great work, young scientists! You now know how your amazing eyes work. Keep exploring the world with curiosity!

CONGRATULATIONS, JUNIOR VISIONARY!

You explored the magic of your eyes!

✨ Keep exploring, protecting, and marvelling at your
amazing eyes!
