

CSS + JS — DARK MODE TOGGLE

**WHO HERE USES
DARK MODE ON
THEIR PHONE
OR APPS?**

WHAT IS DARK MODE?

Dark Mode = Dark background + light text

Used by popular Indian apps:

WhatsApp, YouTube, Zomato, BYJU'S,

Swiggy, Meesho, Flipkart

WHY USE DARK MODE?

Benefits of Dark Mode:

- Saves battery on your device
- Reduces eye strain at night
- Looks super cool!

MEET THE THREE LANGUAGES OF THE WEB

HTML

The chai stall cart — it's the structure that holds everything together!

CSS

Decorations and paint on the cart — it makes everything look pretty and stylish!

JAVASCRIPT

The person making chai and taking orders — it adds behavior and action!

2

ABOUT CSS CLASSES

WHAT ARE CSS CLASSES?

CSS classes are special names that tell elements how to look. Just like wearing a school badge means you follow special rules!

EVENT LISTENERS ARE LIKE DOORBELLS

Just like a doorbell listens for someone to press it and then rings, JavaScript's `addEventListener` waits for something to happen (like a click) and then runs your code!

`addEventListener` listens for clicks → runs your code!

CLASSLIST.TOGGLE() IS LIKE A CEILING FAN SWITCH

Think of a ceiling fan switch at home:

- One press turns the fan ON
- Next press turns the fan OFF

`classList.toggle()` works the same way!

Each click adds or removes a CSS class — like flipping a switch!

HTML SKELETON: LET'S TYPE!

- Create `<h1>` for heading
- Add `<p>` for paragraph
- Make a simple webpage

```
Simple Code Snippet

<!DOCTYPE html>
<html>
  <body>
    <h1>Hello, Coder!</h1>
    <p>Welcome to my webpage.</p>
  </body>
</html>
```

Simple Code Snippet

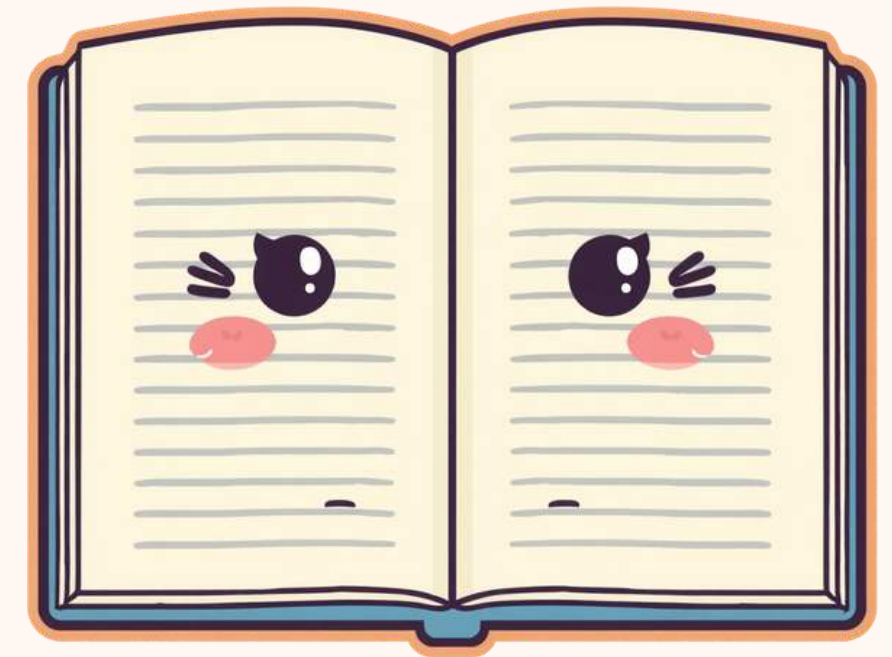

Type along with your teacher

Save your file as **index.html**

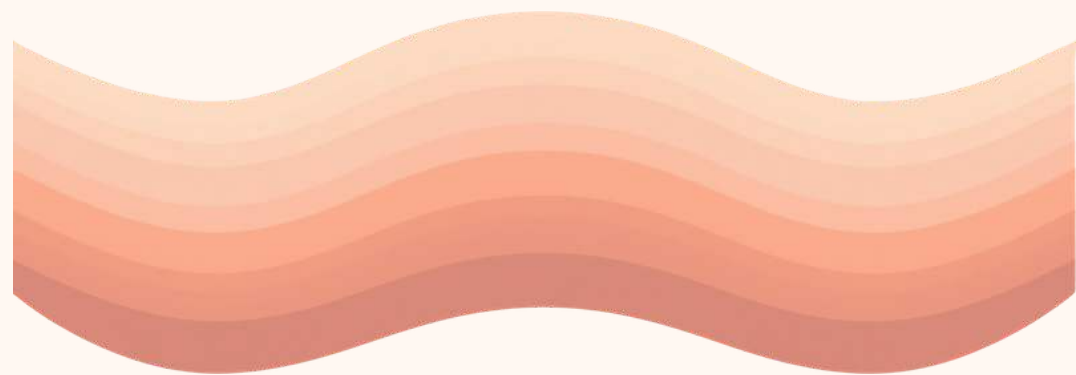

DARK MODE

Dark background + Light tex

LIGHT MODE

Light background (e.g. white #ffffff) + Dark text
(e.g. near-black #121212)

DARK MODE CSS

CSS + JS · Grade 4 Web Development · Dark Mode Toggle Lesson

CSS Set your dark mode colors:

- Background: dark (**#121212**)
- Text color: light (**#f0f0f0**)
- Links: purple (**#6200ea**)
- Smooth transition keeps it looking cool!

STYLE.CSS

```
/* Light Mode (default) */
body {
  background-color: #ffffff;
  color: #121212;
  transition: background-color 0.3s ease,
              color 0.3s ease;
}

/* Dark Mode */
.dark-mode {
  background-color: #121212;
  color: #f0f0f0;
}
.dark-mode a {
  color: #6200ea;
}
```

INDEX.HTML

```
<!-- HTML Structure -->
<body>
  <h1>Hello, Coder!</h1>
  <p>Try toggling the theme!</p>
  <button id="toggle-btn">
    Toggle Dark Mode
  </button>
  <script src='script.js'></script>
</body>
```

SCRIPT.JS **JS**

```
// Step 1: Find the button
const btn = document
  .getElementById("toggle-btn");

// Step 2: Listen for clicks
btn.addEventListener("click", function() {
  // Step 3: Toggle class
  document.body.classList
    .toggle("dark-mode");
});
```

💡 `classList.toggle()` adds the class if absent, removes it if present

JAVASCRIPT: ADDING THE CLICK EVENT

STEP 1 — FIND THE BUTTON

```
// getElementById("toggle-btn")  
// Finds our button in HTML  
// Stores it in a variable  
const btn = document.getElementById("toggle-btn");
```

STEP 2 — LISTEN FOR A CLICK

```
// addEventListener("click", function)  
// Runs code when button is clicked  
btn.addEventListener("click", function() {  
  document.body.classList.toggle("dark-mode");  
});
```

getElementById("toggle-btn")

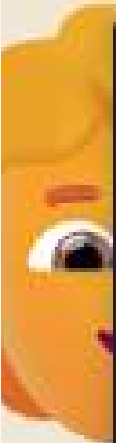

Finds our button in HTML

Stores it in a variable

addEventListener("click", function)

Code snippet with event listener

Runs code when button is clicked

```
<body>  
  <h1>Hello!</h1>  
  <button  
    id="btn">  
  </button>  
  const btn =  
    getElementById  
  btn.addEventListener  
    "click",  
    function
```

JAVASCRIPT: TOGGLE THE DARK MODE CLASS

✚ THE MAGIC LINE

```
// classList.toggle("dark-mode")  
// Adds or removes the class!  
document.body.classList.toggle("dark-mode");
```

HOW IT WORKS — IF / ELSE EXPANDED

```
if (document.body.classList.contains("dark-mode")) {  
    document.body.classList.remove("dark-mode");  
} else {  
    document.body.classList.add("dark-mode");  
}
```

The Magic Line

`classList.toggle("dark-mode")`
Adds or removes the class!

How It Works

Click toggles dark-mode class
Light → Dark → Light again!

RUN YOUR PROJECT & SEE THE MAGIC!

TEST YOUR DARK MODE TOGGLE!

Click the "Run" button in your code editor to see your webpage come alive! Try clicking your toggle button and watch the magic happen. One click turns Dark Mode ON, next click turns it OFF! Keep clicking to see your colors switch back and forth.

PERSONALIZE YOUR DARK MODE COLORS

CHANGE YOUR COLORS

Try changing background-color and color in your CSS. Pick any colors you like for light and dark modes!

USE FUN APP COLORS

Try BYJU'S purple (#6200ea) or Swiggy orange (#fc8019). What colors do your favorite apps use?

GET CREATIVE!

Mix and match colors to make your dark mode unique. There are no wrong answers – explore and have fun!

YOU DID IT! KEEP CODING AND EXPLORING

Try adding dark mode to other websites! Happy
Coding! See you in the next lesson.
