

Mean, Median & Mode

Grade 3 Maths Lesson

In this lesson you will learn three powerful ways to understand numbers — **Mean**, **Median**, and **Mode**. These tools help us find the 'middle' or 'average' of a group of numbers and are used every day in real life!

Learning Goals

- Understand what Mean, Median, and Mode mean.
 - Be able to calculate each one step by step.
 - Recognise which to use in everyday situations.
-

What Is the Mean?

The **mean** is the **average** of a group of numbers. Think of it as 'sharing equally' — if you shared all the numbers fairly, what would each person get?

How to find the Mean:

Step 1 → Add all the numbers together.

Step 2 → Divide by *how many numbers* there are.

Example: Numbers: 3, 5, 7

Add: $3 + 5 + 7 = 15$

Divide: $15 \div 3 = 5$

>> **The Mean is 5!**

Sweet Example: You have 2, 4, and 6 sweets. What is the mean?

Add: $2 + 4 + 6 = 12$

Divide: $12 \div 3 = 4$

>> **The Mean is 4 sweets!**

What Is the Median?

The **median** is the **middle number** when all numbers are lined up from smallest to largest. It splits the list right in the middle!

How to find the Median:

Step 1 → Arrange all numbers from smallest to largest.

Step 2 → Find the number right in the middle.

Example: Numbers: 7, 3, 5 → Arranged: 3, 5, 7

The middle number is **5**.

>> **The Median is 5!**

Heights Example: 5 friends are 110, 115, 120, 125, 130 cm tall.

Already in order! The middle (3rd) value is **120 cm**.

>> **The Median height is 120 cm!**

What Is the Mode?

The **mode** is the number (or value) that appears **most often** in a group. A group can have more than one mode, or no mode at all!

How to find the Mode:

Step 1 → Count how many times each number appears.

Step 2 → The one that appears the most is the Mode.

Example: Numbers: 2, 2, 3, 4, 5

2 appears **twice**, all others appear once.

>> **The Mode is 2!**

Colours Example: red, blue, red, green, red, blue, yellow

red = 3 times | blue = 2 times | green = 1 | yellow = 1

>> **The Mode is red (appears the most)!**

Quick Reference

Concept	What it means	How to find it
Mean	The average	Add all → divide by count
Median	The middle number	Sort → pick the middle
Mode	Most frequent	Count → pick the most common

Let's Practice!

Mean Practice

Q	Numbers	Your Answer	Answer
---	---------	-------------	--------

1	4, 6, 8		6
2	1, 3, 5, 7		4
3	2, 5, 8		5

Median Practice

Q	Numbers	Your Answer	Answer
1	5, 9, 2		5
2	1, 4, 7, 8, 10		7
3	3, 6, 1, 8, 4		4

Mode Practice

Q	Numbers	Your Answer	Answer
1	3, 3, 5, 7		3
2	2, 4, 4, 4, 5		4
3	6, 8, 6, 9, 6		6

Real Life Uses

Real Life Uses

- **Mean** — Finding a cricket player's average score per game.
- **Median** — Discovering the middle height in your class.
- **Mode** — Finding the most popular colour chosen by your classmates.
- **All three** together help us make sense of data all around us!

What We Learned

Mean = Add all numbers ÷ how many

Median = Middle number when sorted smallest → largest

Mode = The number that appears most often

Great job! Keep practising and you'll be a statistics superstar!
