

MY DYNAMIC DIGITAL FESTIVAL CARD

The Ultimate Diwali Coding Adventure!

🔥 Look What We'll Make Today!

Get ready to build something truly magical! We are going to create a glowing **Digital Diwali Card** using the three pillars of the web: **HTML, CSS, and JavaScript**. Your special card will light up, show a warm festive message, and sparkle with beautiful colors—just like real Diwali fireworks !

🎨 The Magic of Web Crafting

Building a webpage is just like crafting your favorite decorations for a festival. Each code ingredient plays a special role :

Code Language	Festival Metaphor	What It Does For Your Card
🧱 HTML	🎈 Kite (Patang) Frame	Builds the skeleton, frame, and structure of your card layout .
🎨 CSS	🎨 Rangoli Colors	Paints your card bright, beautiful, and full of festive style .
⚡ JavaScript (JS)	💡 Fairy Lights Switch	Makes your card come completely alive with interactive magic !

Step-by-Step Code Construction

Step 1: HTML Structure

Building the Kite Frame

First, let's put text contents onto our screen. Find the `<h1>` tag in your file workspace . Replace the sample text with your own name, and remember to keep both your opening and closing tags intact .

```
<h1>Happy Diwali from Alex!</h1>
```

Tip: Always make sure your HTML closing tags have a neat forward slash (/) so the browser doesn't get confused !

Step 2: CSS Styling

Painting Our Card Background

Now, let's splash some beautiful festival colors over the blank page . Locate the body selector inside your style section . Change its `background-color` property to your favorite theme value :

```
body {  
    background-color: gold; /* Try gold, crimson, or orange! */  
}
```

Save your code workspace to see the background transform immediately . Try changing it to `crimson` or `orange` to create your unique look .

Break Time & Bug Hunt!

Code errors are called **bugs** . Can you find the bug in this broken HTML sentence ?

```
<h1>Happy Diwali</h1
```

The Fix: The closing tag is missing its final > symbol ! Fix it up to look like </h1>, save your work, and your bug is caught .

Step 3: JavaScript Interactivity

💡 Flipping the Fairy Lights Switch

Let's make our screen interactive so it responds when clicked ! We will build a function called `showMessage()` that pops up an alert box carries your personal greeting .

Add this code snippet to your file workspace :

```
function showMessage() {  
    alert("🎆 Wishing you a sparkling Diwali full of joy and lights! ✨");  
}
```

Next, tie this magic trick to your interactive button tag using the `onclick` trigger option :

```
<button onclick="showMessage()">Click to Light Up Card!</button>
```

🌟 Customize & Showcase!

Now that the core code engine is alive, use your fantastic creativity to personalize your dynamic card artwork :

- 🖋️ **Your Words:** Rewrite the inner text inside the alert function to match your greeting style .
- 🎨 **Theme Mix:** Pair matching font colors with bright festive backgrounds .
- 🕯️ **Emojis & Symbols:** Add firework symbols (🎆) or lit clay diyas (🕯️) inside your code sentences !

🎆 Show & Tell Time!

You did it! You built your very own interactive, dynamic digital card . Open your folder, show your glowing creations to your family and friends, and explain exactly how you coded the magic switches . You are officially a web creator now !
