

**COLOUR MY
WEBPAGE!**

WHAT IS HTML?

HTML helps us build webpages! Think of it like a recipe that tells the computer what to show. Just like a recipe has steps, HTML has special words called tags that give instructions to make webpages look nice and colorful!

HTML is the language that makes the internet come alive!

ADDING COLOURS TO HTML

Colours make webpages fun and pretty! With HTML, we can paint our webpages with any colour we like.

Colours brighten up text and backgrounds on webpages.

We can choose many colours with HTML code!

THE COLOUR TAG: STYLE

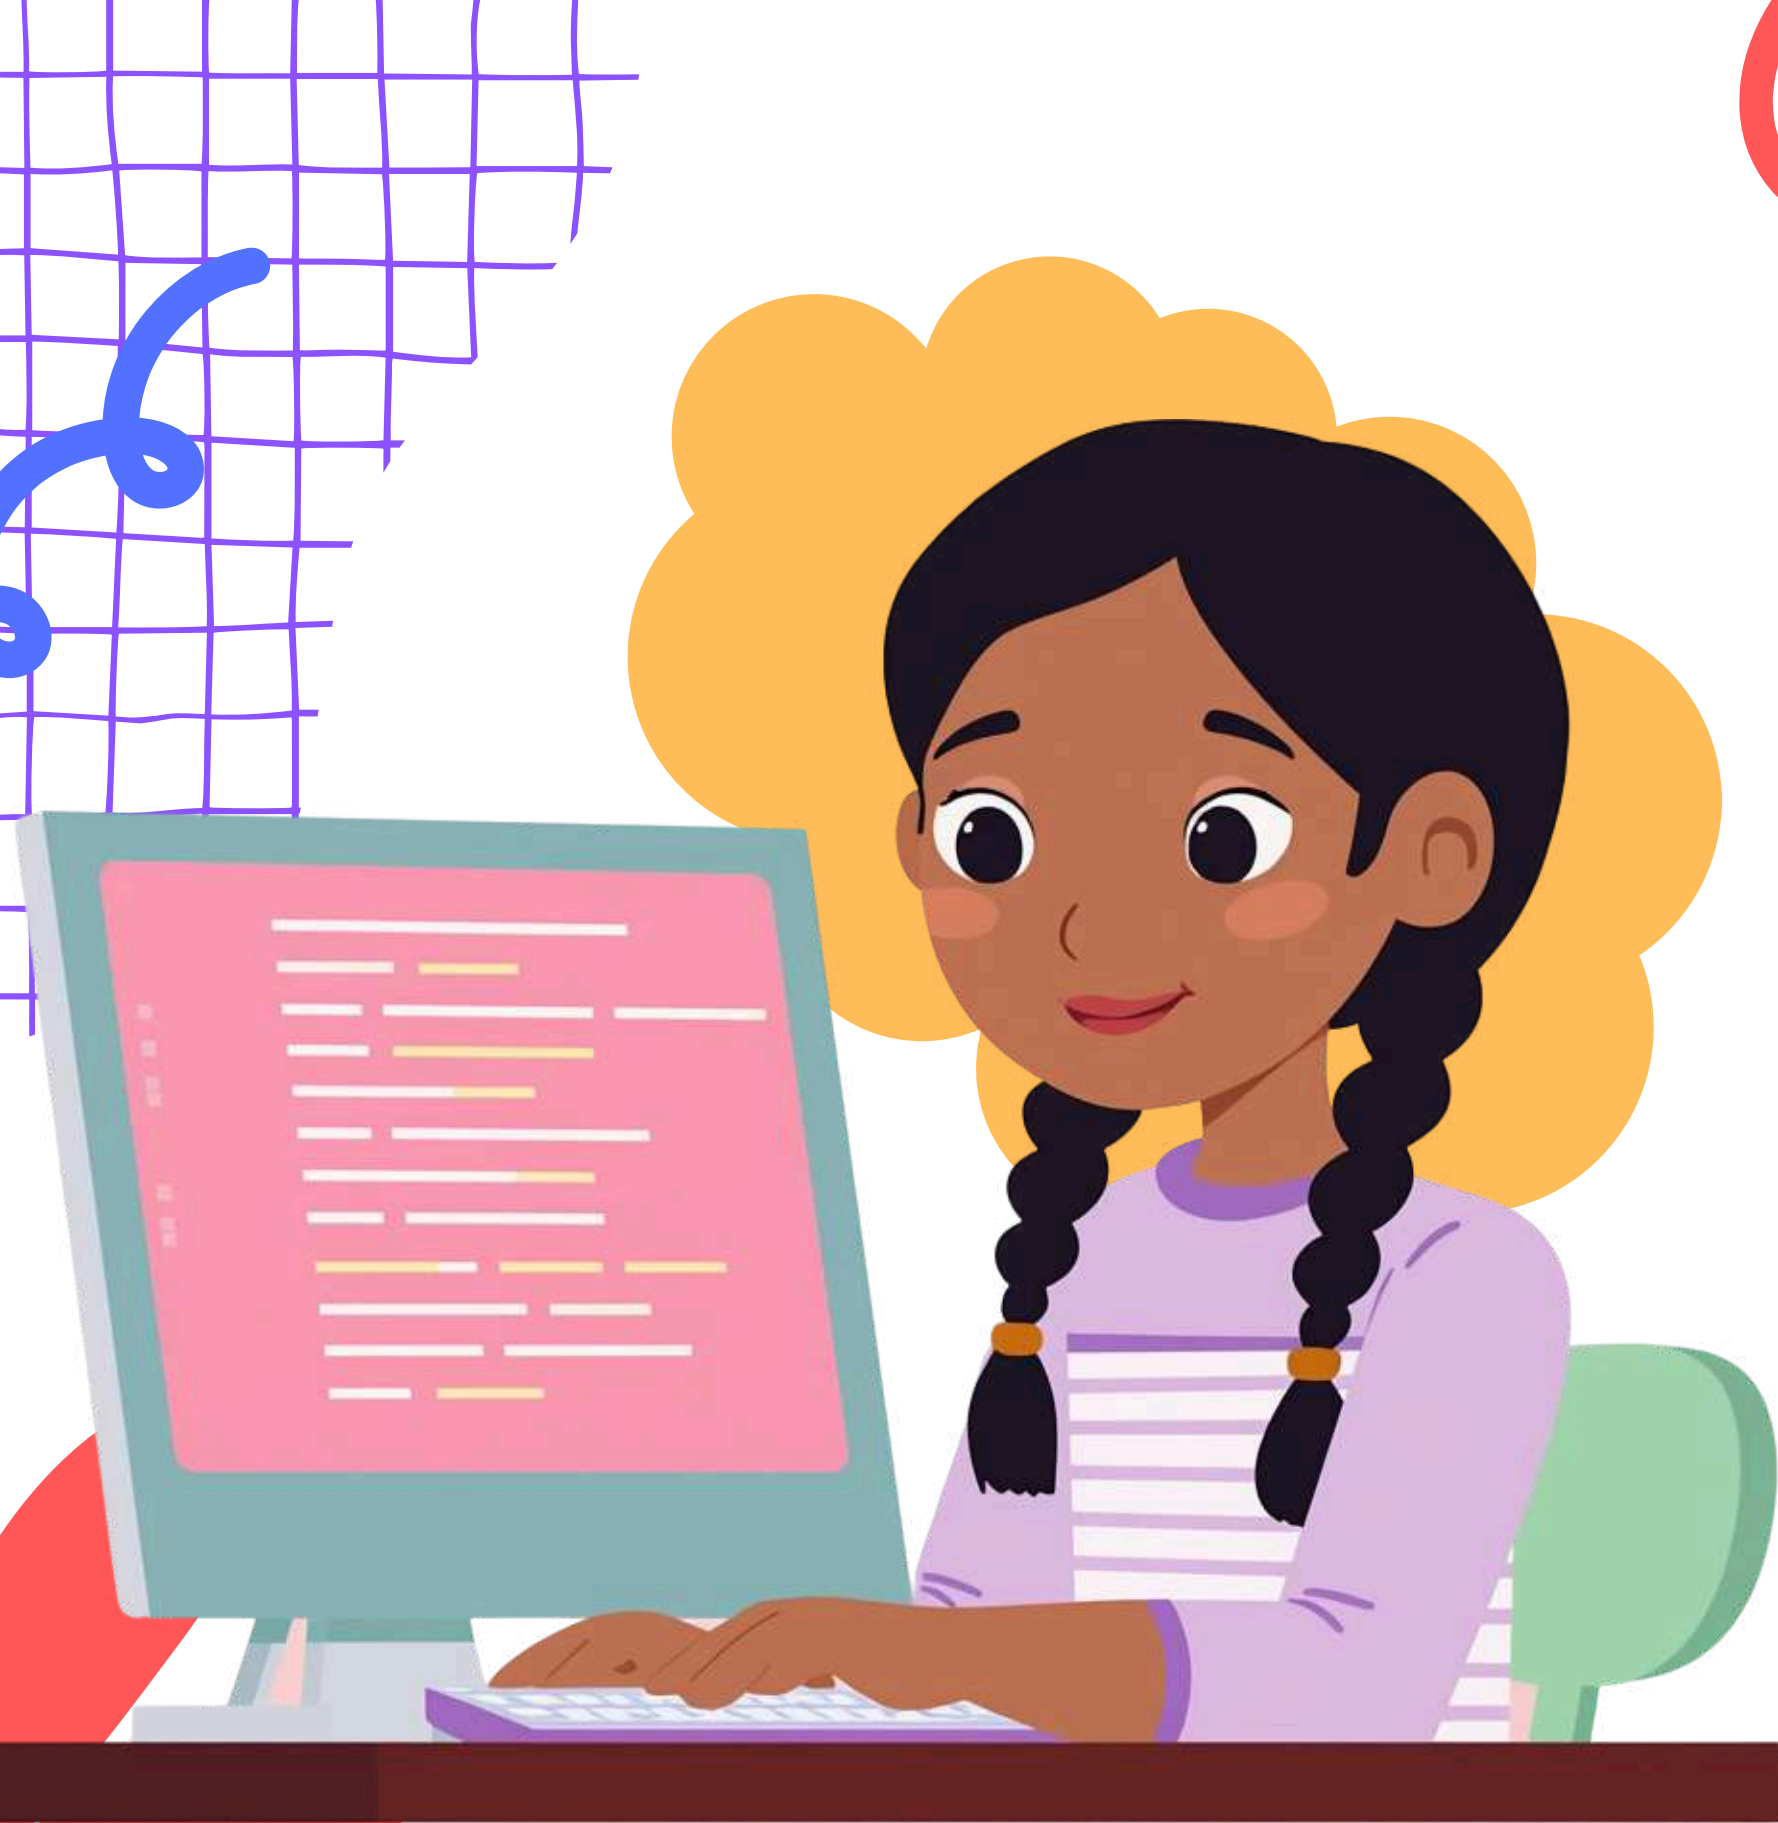

We use the 'style' tag to add colours to our webpage! Here's how it works:

Example code:

This makes the text red! The word 'color' tells the computer what to change, and 'red' is the colour we want.

Try changing 'red' to other colours like blue or green!

COLOUR NAMES YOU CAN USE

These are simple colour names you can use in HTML! Try typing these names in your style tag to see the magic happen.

Red – Makes your text bright and bold!

Green – Fresh like leaves and grass!

Blue – Cool like the sky and ocean!

Purple – Royal and magical!

WHAT ARE HEX CODES?

Secret Colour Codes!

Hex codes are special codes for colours! They start with # and have 6 letters or numbers. Example: #FF0000 means red!

Try using hex codes to unlock more colours!

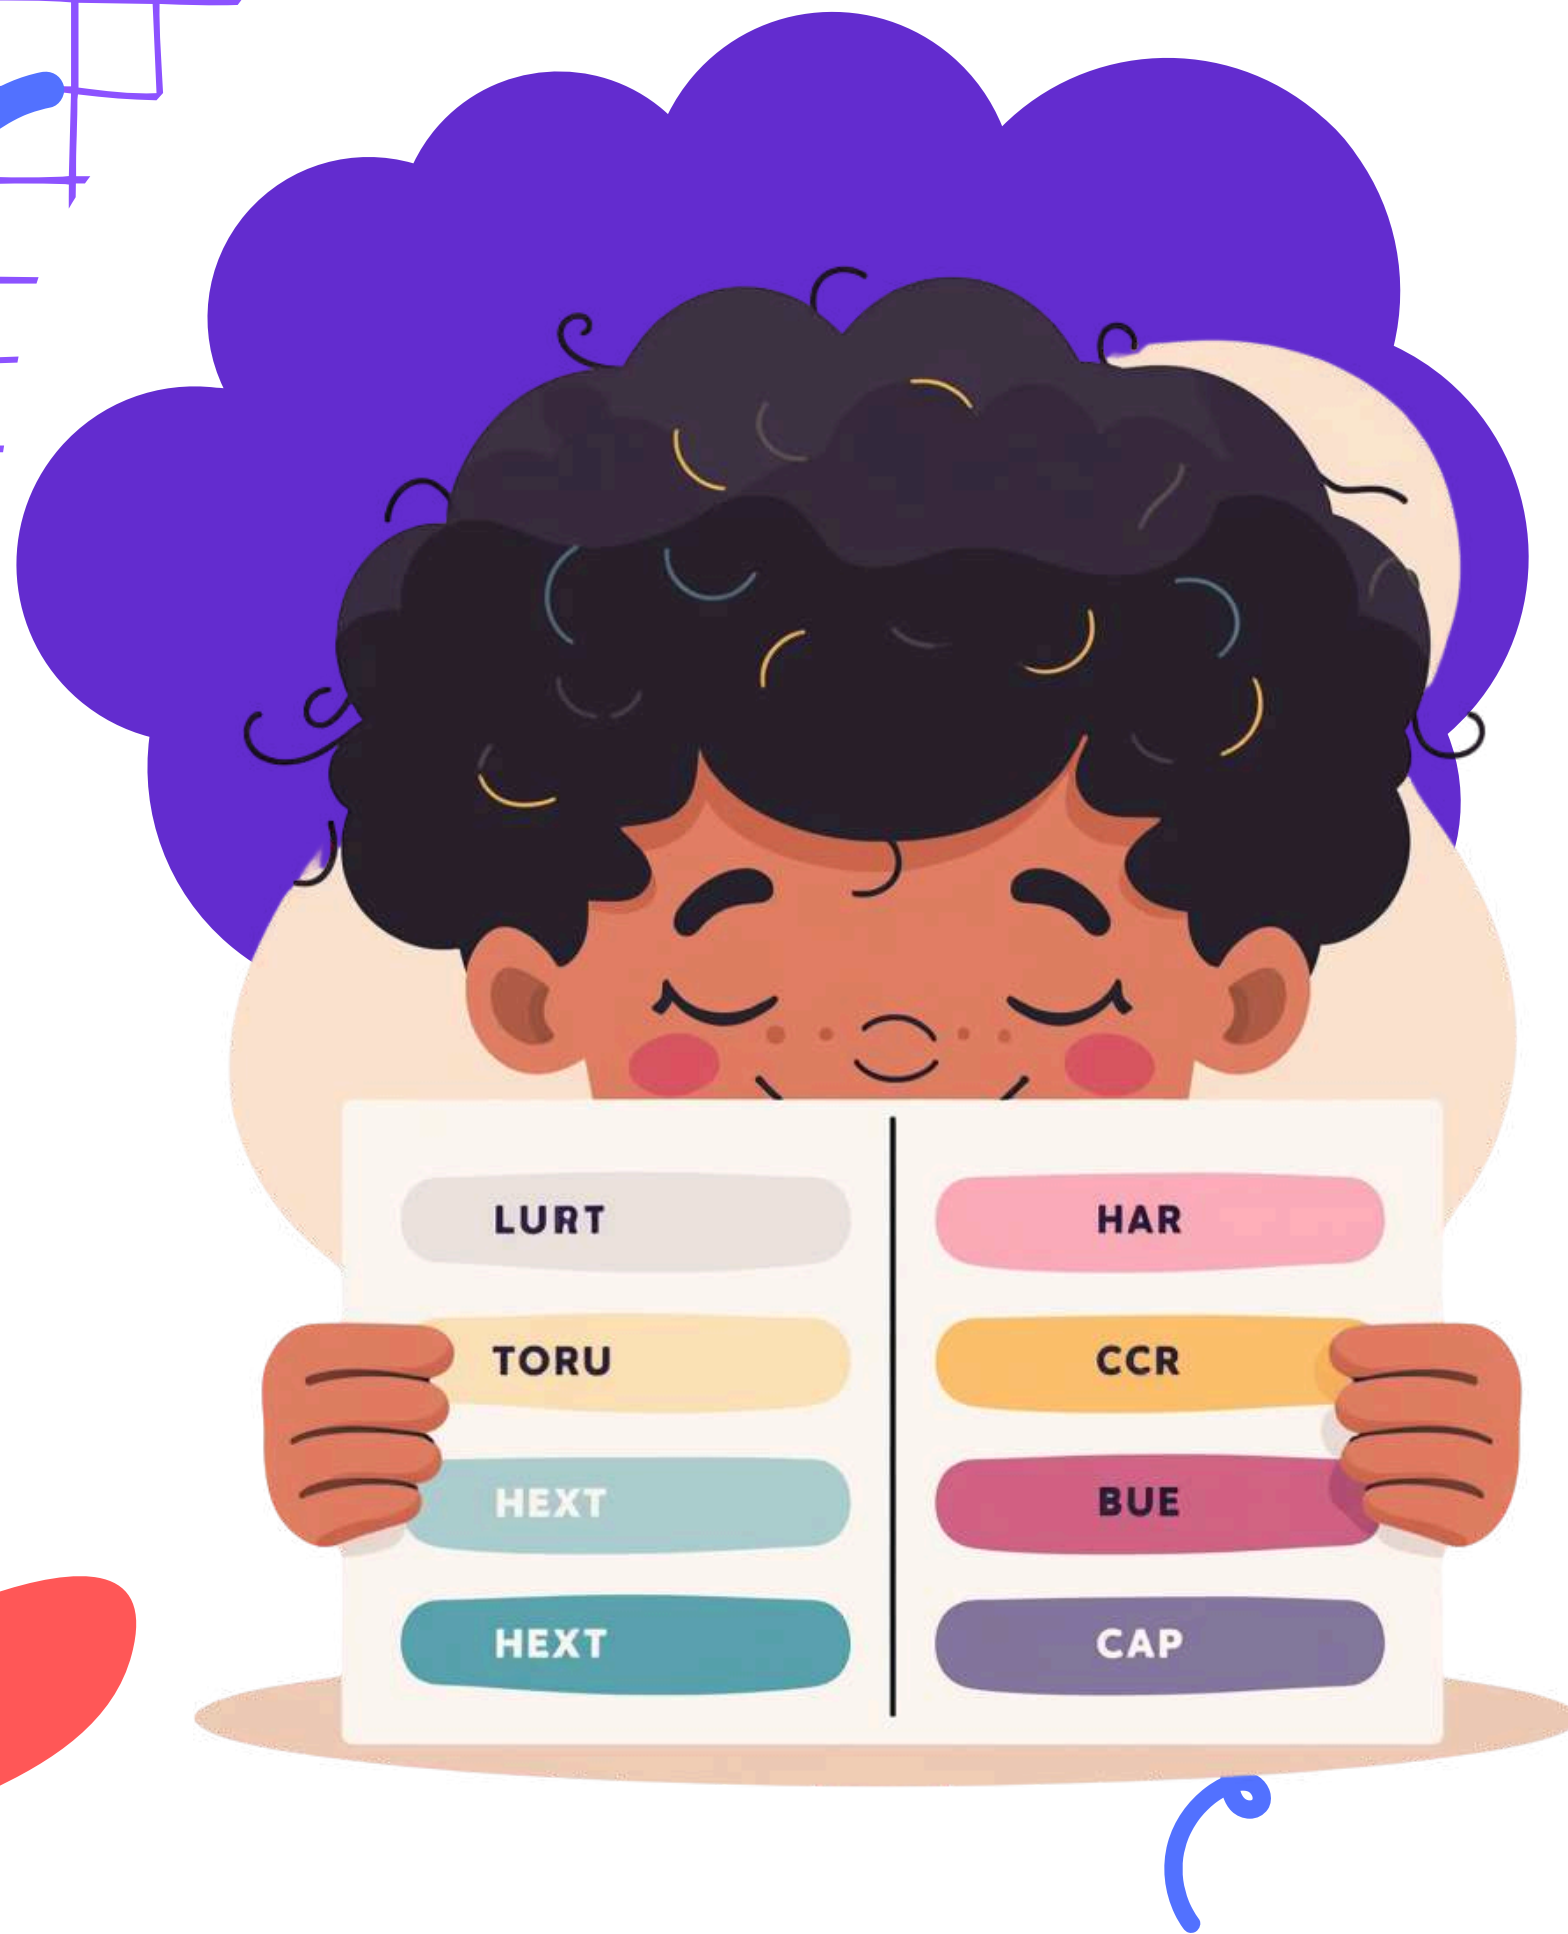

COLOUR NAMES VS HEX CODES

There are two ways to add colours in HTML! Colour names are easy words like "red" and "blue". Hex codes give you more colour choices!

Colour Names: Easy to remember! Just type red, blue, green, purple.

Hex Codes: More choices! Try #FF69B4 for pink or #87CEEB for sky blue.

CHANGING BACKGROUND COLOUR

Want to change your whole webpage's colour? Use the background-color style!

Example code:

This makes your page a lovely peach colour! You can use colour names like "pink" or hex codes like "#FFDAB9" to pick any shade you like.

**Try changing the
background to your
favourite colour!**

MEET OUR FRIENDS CODING!

Learning Together is Fun!

Look at these amazing coders! They are learning to add beautiful colours to their webpages using HTML. You can do it too!

Our friends are learning to colour their webpages too!

PRACTICE TIME: COLOUR THE TEXT!

Now it's your turn to try! Follow these simple steps to make your text colourful and fun.

Pick a colour name or hex code you like.

Type it inside the style tag in your code.

See your text change colours like magic!

PRACTICE TIME: COLOUR THE BACKGROUND!

Now let's make your whole webpage
colourful! You can change the
background colour using colour
names or hex codes.

Change the background colour
with hex codes or colour names.

Make your page bright and fun to
look at!

FUN WITH COLOURS: MIX AND MATCH

Get creative with your webpage! You can use many colours together to make your page look amazing and unique.

Colour headings one colour, text another!

Use different background colours on different pages.

Try pastel colours for a soft, gentle look.

REMEMBER THESE TIPS!

Here are the important things to remember when adding
colours to your HTML webpages!

Use `style="color: colourname;"` for text

Use `style="background-color: hexcode;"` for backgrounds

Have fun experimenting with colours!

YOUR COLOURFUL WEBPAGE AWAITS!

Every webpage is a blank canvas — paint it with colour! Your imagination is the only limit. Use all the colours you've learned to make your webpage bright, beautiful, and uniquely yours!
