

Grade 3 Coding: Create Your Own Personalised Report Card!

Let's learn Python and make coding fun!

Presented by: Monu Kumar • June 2026

Welcome, young creators! Today, we are going to dive into the world of computer science and learn how to make our very own interactive program using a coding language named **Python**. By the end of this lesson, you will be a coder who can build a custom application from scratch!

What is a Report Card?

A report card is a special document that shows how well you did in your school subjects over the term! It lists all the things you learned and how well you mastered them. Common school subjects include:

- **Maths:** Working with numbers and shapes
- **Science:** Exploring nature, space, and experiments
- **English:** Reading, writing, and stories
- **Hindi:** Learning literature and grammar
- **Computer Science:** Discovering technology and coding!

What is Coding?

Coding means telling the computer what to do, step by step—just like giving directions or a recipe to a friend! Computers are super smart, but they need us to guide them precisely.

- **Coding is fun and creative:** It lets you build games, apps, and tools out of your own imagination.
- **It helps us solve problems:** Breaking big tasks down into little pieces makes tricky logic easy!

Meet Python!

Python is an incredibly friendly language used by developers worldwide. It reads almost like plain English, making it perfect and easy for children to learn!

Try This Simple Command:

```
print("Hello!")
```

This instruction tells the computer to instantly display the word **Hello!** right on your screen.

Variables: Storing Information

A **variable** is like a magical storage box that holds information so the computer can remember it later. You give the box a unique name and store something fun inside!

EXAMPLE CODE:

```
name = "Anaya"
```

Here, **name** is the label on our box, and "Anaya" is the piece of text sitting safe inside!

BOX LABEL: NAME

Anaya

Input: Asking Questions

What if we want our program to talk to us? We can ask users questions and capture their dynamic answers using the **input()** command!

ASKING A QUESTION:

```
name = input("What is your name? ")
```

When this code runs, the computer stops, prints your question, and patiently waits for you to type your response on the keyboard!

Print Statements: Showing Messages

The **print()** function instructs the computer to output messages, values, or calculations onto the monitor display screen.

COMBINING STRINGS AND VARIABLES:

```
print("Welcome, " + name)
```

If the variable `name` holds the text "Anaya", the output screen will beautifully show: `Welcome, Anaya!`

Project Overview: Personalised Report Card

Now, let's assemble everything we've learned to construct our main project! We will build a program that generates a tailored report card.

Our program will execute these 4 interactive steps:

1. Ask for the student's name
2. Ask for their marks in each subject
3. Print out a complete, clean report card layout
4. Cheer them on with an upbeat "Well done!" message

Step 1: Asking for Your Name

```
name = input("Enter your name: ")
```

Step 2: Getting Your Marks

We'll create a standalone storage variable box for every single subject:

```
math = input("Enter Math marks: ")
science = input("Enter Science marks: ")
english = input("Enter English marks: ")
```

Step 3: Showing Your Report Card Layout

Let's display the gathered variables nicely back to the screen:

```
print("-----")
print("Name: " + name)
print("Maths: " + math)
print("Science: " + science)
print("English: " + english)
print("-----")
```

Step 4: Saying Well Done!

Let's add a custom congratulatory cheer at the bottom of our script:

```
print("Great job, " + name + "!")
```

Now It's Your Turn! Try It Yourself

Run your complete Python script in your environment and experiment with updating the outputs. Here are a few creative things you can try:

- **Personalise it:** Change the inputs to use your real name and actual class grades!
- **Add more subjects:** Expand your project by tracking Art, Music, or physical education Sports marks.
- **Add customized messages:** Adjust the ending print statements to make them funny, helpful, or kind.
- **Incorporate emojis:** Insert visual icons like star (★), smileys (😊), or thumbs-up (👍) right inside your text strings!

🎓 Summary: What We Learned Today

- **Coding is a superpower:** It gives us the fun ability to build original, helpful interactive tools.
- **Variables:** These serve as practical labeled boxes that store data or values safely inside a computer.
- **input():** Asks the user questions and waits for keyboard text entry.
- **print():** Sends words, symbols, or structured reports out to your presentation screen.

"Coding is a superpower — keep practicing, exploring, and creating!"

Thank you for learning with us! Any questions? Let's discuss and code together!
