

■ ADD AN IMAGE!

Making Webpages Come Alive with Pictures

In this lesson you will learn the **one HTML tag** that puts every single picture you see on the internet onto a webpage — and it's only three letters long!

■ What You Will Learn

- ✓ What the **** tag is
- ✓ The **src** attribute — telling the browser WHERE the image is
- ✓ The **alt** attribute — a backup description of your image
- ✓ Why **** is self-closing (no closing tag needed!)
- ✓ How to write correct image code and spot bugs

Level: Beginner

Subject: HTML / Web Design

Pages: 4

1 Why Pictures Matter on a Webpage

Imagine two webpages about idli-sambar. One has only boring text. The other has a delicious photo. Which one grabs your attention? **Pictures make everything better!** Every image you have ever seen on a website was placed there using just **one** HTML tag.

2 The Tag — The Big Reveal

The magic tag is ****. Think of it like a photo frame on your wall — the frame is the tag, but you also need to tell it **which photo** to show inside!

IMG = IMaGe = PICTURE TIME! ■

3 The src Attribute (5th Tip)

src stands for **SOURCE** — it is the address that tells the browser exactly *where* to find the image file. Always give the browser the full address!

```

```

4 The alt Attribute (6th Tip)

alt stands for **ALTERNATIVE TEXT** — a short description of what the image shows. If the image cannot load, the browser shows this text instead. Think of it like Dadi's labels written under family photos! ■

```

```

5 The Tag Stands Alone! (Self-Closing)

Most HTML tags come in **pairs** like chappals: **<p>Hello!</p>**. But **** is like a bindi — just **ONE**, and it is complete! No closing tag needed. One tag → picture done! ■

■ Other tags (pairs)	■ (self-closing)
<pre><p>Hello!</p></pre>	<pre></pre>

6 Full Code Example

Here is a complete HTML page that shows a samosa image with a heading and description:

```
<!DOCTYPE html>
<html>
<head>
<title>My Favourite Food</title>
</head>
<body>
<h1>My Favourite Indian Snack</h1>

<p>I love eating samosas after school!</p>
</body>
</html>
```

7 Image Examples You Can Use

Try using these fun Indian-themed image filenames in your **src** attribute:

samosa.jpg	dosa.jpg	diwali.jpg
peacock.jpg	cricket.jpg	— your own photo! —

8 Bug Spotting Round! ■

Can you find what is wrong with each line of code below?

Bug 1 — Missing alt:

```

```

Bug 2 — Wrong closing tag:

```
</img>
```

Bug 3 — Missing quotes:

```
<img src=cricket.jpg alt=cricket bat>
```

9 Try It! Build YOUR Picture Page ■

Follow these steps to make your own picture webpage:

Step 1	Create a new file called mypictures.html
Step 2	Add your name inside a heading: <h1>My Name</h1>
Step 3	Add ONE image using the tag
Step 4	Write about it using a <p> paragraph tag
Step 5	Open the file in your browser and SEE your picture! ■

Topic ideas for your image:

■ Food ■ Festival ■ Animal ■ Sport ■ Nature

10 Stretch Challenge: Code Scientists! ■

Fast finishers — try adding a **width** attribute to control the size of your image!

```

```

What happens when you change **300** to **100**? Or **600**? Experiment and discover! ■

■ RECAP — What We Learned Today!

	The tag that puts a picture on your webpage
src=' '	The ADDRESS of the image — tells the browser WHERE to find it
alt=' '	A DESCRIPTION of the image — backup text if the image doesn't load
Self-closing	 needs NO closing tag — one tag and you're done!

■ You earned the IMAGE WIZARD BADGE!

You're a Real Web Developer Now!

If Arjun in Grade 1 can do it — so can you! ■
