

■ Skittles Rainbow ■

Science Experiment

Fun with Colours and Water!

In this magical experiment, you will arrange colourful candies in a circle on a white plate, pour warm water in the centre, and watch a beautiful rainbow appear as the colours **dissolve** and travel inward! Get ready to think like a real scientist!

■ Warm-Up: Magic Water Wonder

Watch sugar disappear in warm water! When you put sugar in warm water and stir it, something magical happens — the sugar **disappears**!

■ **KEY POINT:** Sugar dissolves when mixed with warm water. The sugar breaks into tiny pieces so small we cannot see them anymore!

■ What's in the Candy Coating?

Candies have a **colourful sugar coating** on the outside! When you look closely at a candy, you can see a shiny coloured shell. This shell is made of sugar mixed with bright colours (dye).

It's just like **Holi colours** floating on water! The colours sit on top and are ready to dissolve when they meet warm water.

■ Candy Outside

A thin layer of coloured **sugar + dye** coats the candy. This coating dissolves quickly in warm water.

■ Did You Know?

The inside chocolate or sweet does **NOT** dissolve — only the coloured coating does! That's why the rainbow forms at the edge first.

■ Prediction Time! What Will Happen?

Before we begin, **every scientist makes a prediction!** Take a moment to guess. Will the colours stay still? Will they move? Will they mix together?

My Prediction: I think the colours will _____

■ Every guess is a good guess! Scientists always predict before they try.

■ Let's Do the Experiment!

1

Place colourful candies in a **neat circle** on a white plate. Use at least 4 different colours. Space them evenly!

2

Pour **2–3 tablespoons of warm water** carefully into the centre of the plate. Do not splash!

3

Watch carefully as the colours start to move! Do not touch the plate or bump the table.

4

After 2–4 minutes, observe the beautiful **rainbow pattern** that forms on the plate!

■ SAFETY NOTE: Water must be warm, not boiling. Only the teacher pours water. Do not eat the candies after the experiment.

■ Watch the Colours Travel!

Look! The colours are **moving towards the middle** of the plate! Each colour stays in its own lane — they don't mix together. It's like **magic rainbow roads!**

The warm water helps the coloured sugar coating **dissolve** and flow inward. Watch carefully as the beautiful rainbow pattern forms right before your eyes!

Inward Travel

Colours move toward the centre of the plate

Own Lanes

Each colour travels in its own path without mixing

Speed

Warm water makes colours move faster than cold water

■ Why Warm Water?

■ WARM WATER

Helps the candy coating **dissolve faster!**
The colours travel quickly and make a beautiful rainbow. Like sugar dissolving fast in hot chai ■

❄️ COLD WATER

Makes the colours move **slowly**. The candy coating takes longer to dissolve. Like sugar sitting at the bottom of cold nimbu paani ■

■ Vocabulary Words to Remember

DISSOLVE

When a solid mixes completely into a liquid

OBSERVE

Watch carefully with your eyes

PREDICT

Make a guess before trying

TRAVEL / FLOW

How colours move through water

■ Where Else Do We See This?

Connect to Indian daily life examples of dissolving!

■ Sugar in Chai

■ Nimbu Paani

■ Holi Colours

■ Salt in Dal

■ Halwa Making

■ Food Colours

Safety First! ■■■

Water must be **WARM**, not hot — ask your teacher to check the temperature!

Do **NOT** eat the candies after the experiment — they have been in water.

Keep your plate **FLAT** and still — no bumping the table during observation!

Only the **TEACHER** pours the water — sit back and watch the magic!

Draw What You Saw! ■■

Use crayons to show the beautiful colours you saw travelling across the plate. Did the colours stay in lanes? Which colour moved the fastest?

■■ Draw your rainbow plate here! ■■

■ You Are a **SCIENTIST**! ■ You observed, predicted, and discovered something amazing — just like real scientists do every day! Keep exploring the magic of science all around you! ■
