

■ AIR HAS WEIGHT

THE BALLOON EXPERIMENT

Grade 1 Science • Planrs Academy

What is inside a Balloon?

Look at two balloons — one is flat and one is big and round. What do you think is inside the blown-up balloon? In this lesson, we will discover the amazing truth: **air has weight!**

■ Does Air Weigh Anything?

Can you feel air? Does it weigh anything at all? Think about it before we do the experiment!

■ Materials Needed for the Experiment

■ Balloons (Gubbaara)	Two balloons of the same size
■ Stick (Danda)	A long, straight stick or ruler
■ String (Dhaga)	Enough to tie both balloons to the stick

■ Experiment Steps

1

Tie the Balloons

Take your stick (danda) and tie one balloon (gubbaara) to each end using string (dhaga). Make sure the knots are tight so the balloons don't fall off!

- Tie one balloon to each end
- Use string to make strong knots on both sides

2

Blow Up One Balloon!

Now comes the fun part! Take one balloon and blow air into it. Watch it grow bigger and bigger! Keep the other balloon flat — don't blow into it at all.

- Blow air into one balloon (gubbaara)
- Keep the other balloon flat and empty

3

Balance the Stick!

Place the stick on your finger and try to balance it. Watch carefully! Which side will go down? Get ready for the exciting result!

- Balance the stick on your fingertip
- Watch which side tips down — the surprise is coming!

■ Observation: Which Side Goes Down?

Look carefully! The stick tips down on the side with the blown-up balloon. The flat balloon stays up high. This shows us that the balloon with air inside is heavier!

■ THE FULL BALLOON SIDE GOES DOWN!

■ WOW! Air Has Weight!

The full balloon is heavier because it contains air. Air is a real substance — it has weight! Even though we cannot see air, the experiment proves it is there and has mass.

■■ Indian Life Connections

■ Football (Gend)

A flat football (gend) is soft, but pumped with air it is heavy and ready to play! Watch chacha pump the football at the shop. Hawa (Air) makes the gend strong!

■ Cycle and Auto Tyres Need Air!

Cycle and auto-rickshaw tyres need air to work properly. When tyres are flat, they are soft and hard to ride. When filled with air, they become round and ready to go!

■ Puri Puffing in the Kitchen!

Puri puffs up because of air inside when frying in hot oil. Watch Amma make puris — they fill with air and become round and fluffy! Hawa (Air) makes puri special!

■ KEY WORD

WEIGHT (Bhaari)

Air has weight. Bhaari means heavy!

■ Try This at Home!

Do this fun experiment at home with your family! Ask Amma or Didi to help you. It is easy and exciting to see that air has weight!

■ 1. Find balloons and a stick

■ 2. Tie and balance

■ 3. Ask for help!
