

AIR PRESSURE — CAN CRUSH!

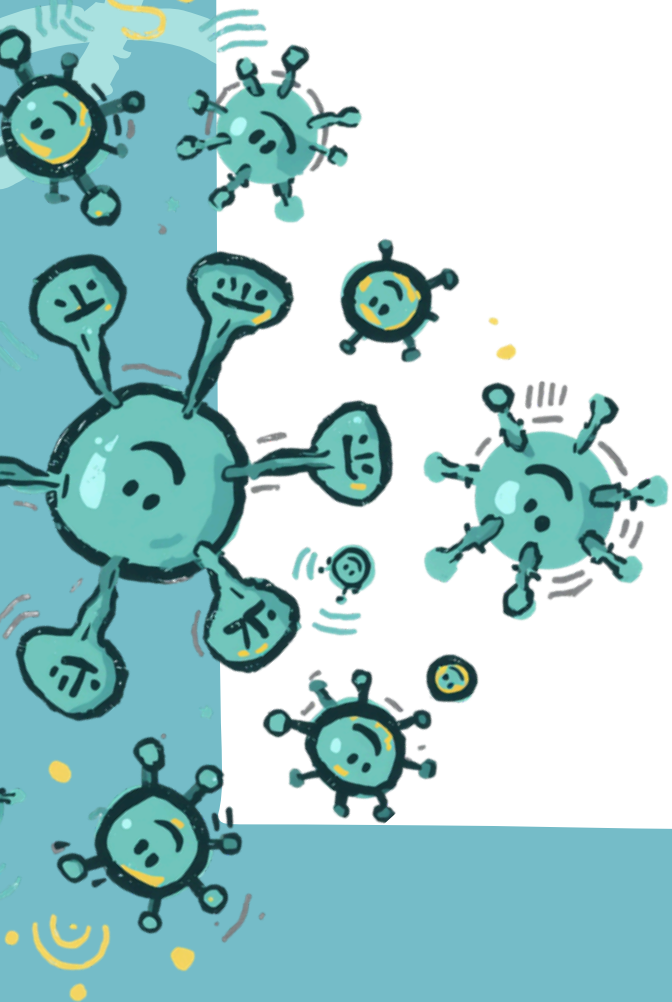

**Can NOTHING
Crush This
Bottle?**

Air Is Everywhere and Always Pushing

Air (Hawa) is all around us and pushes from every side. Air pushes the balloon outwards!

What Happens If We Take Air Out?

What do you think will happen if we take air out of a bottle? Make your guess!

The Bottle-Crush Experiment

Your lungs

Empty bottle

bottle cap

Suck air out of
the bottle

Watch it stay
crushed!

Materials You Need:

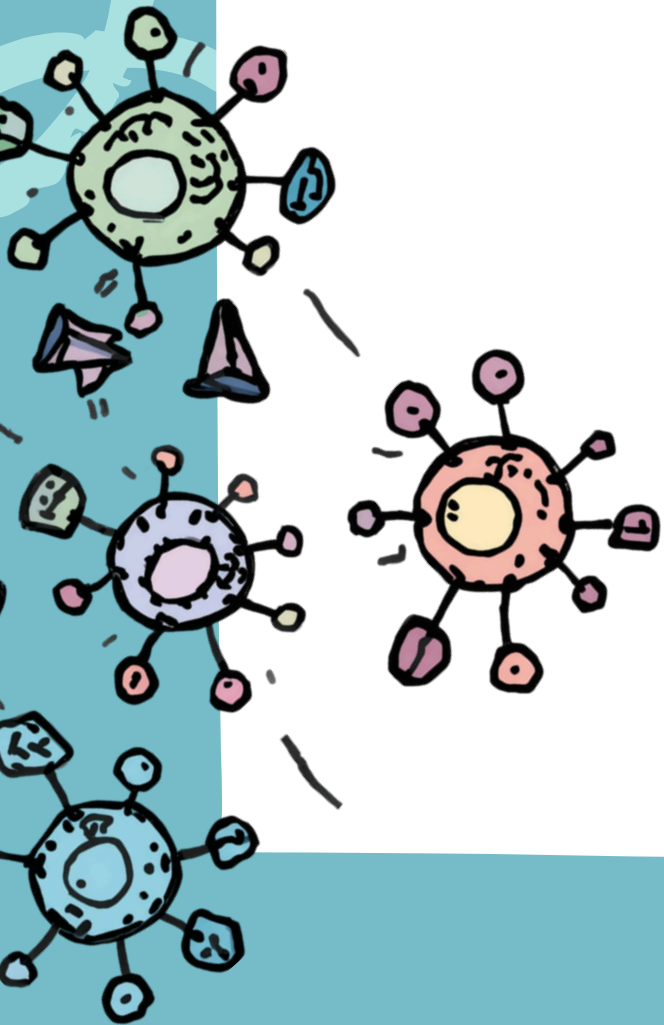

Put on the cap
quickly

Follow These Steps:

What Did We See?

The outside air
pushes (Dhakka)
hard and
crushes (Dabna)
the bottle!

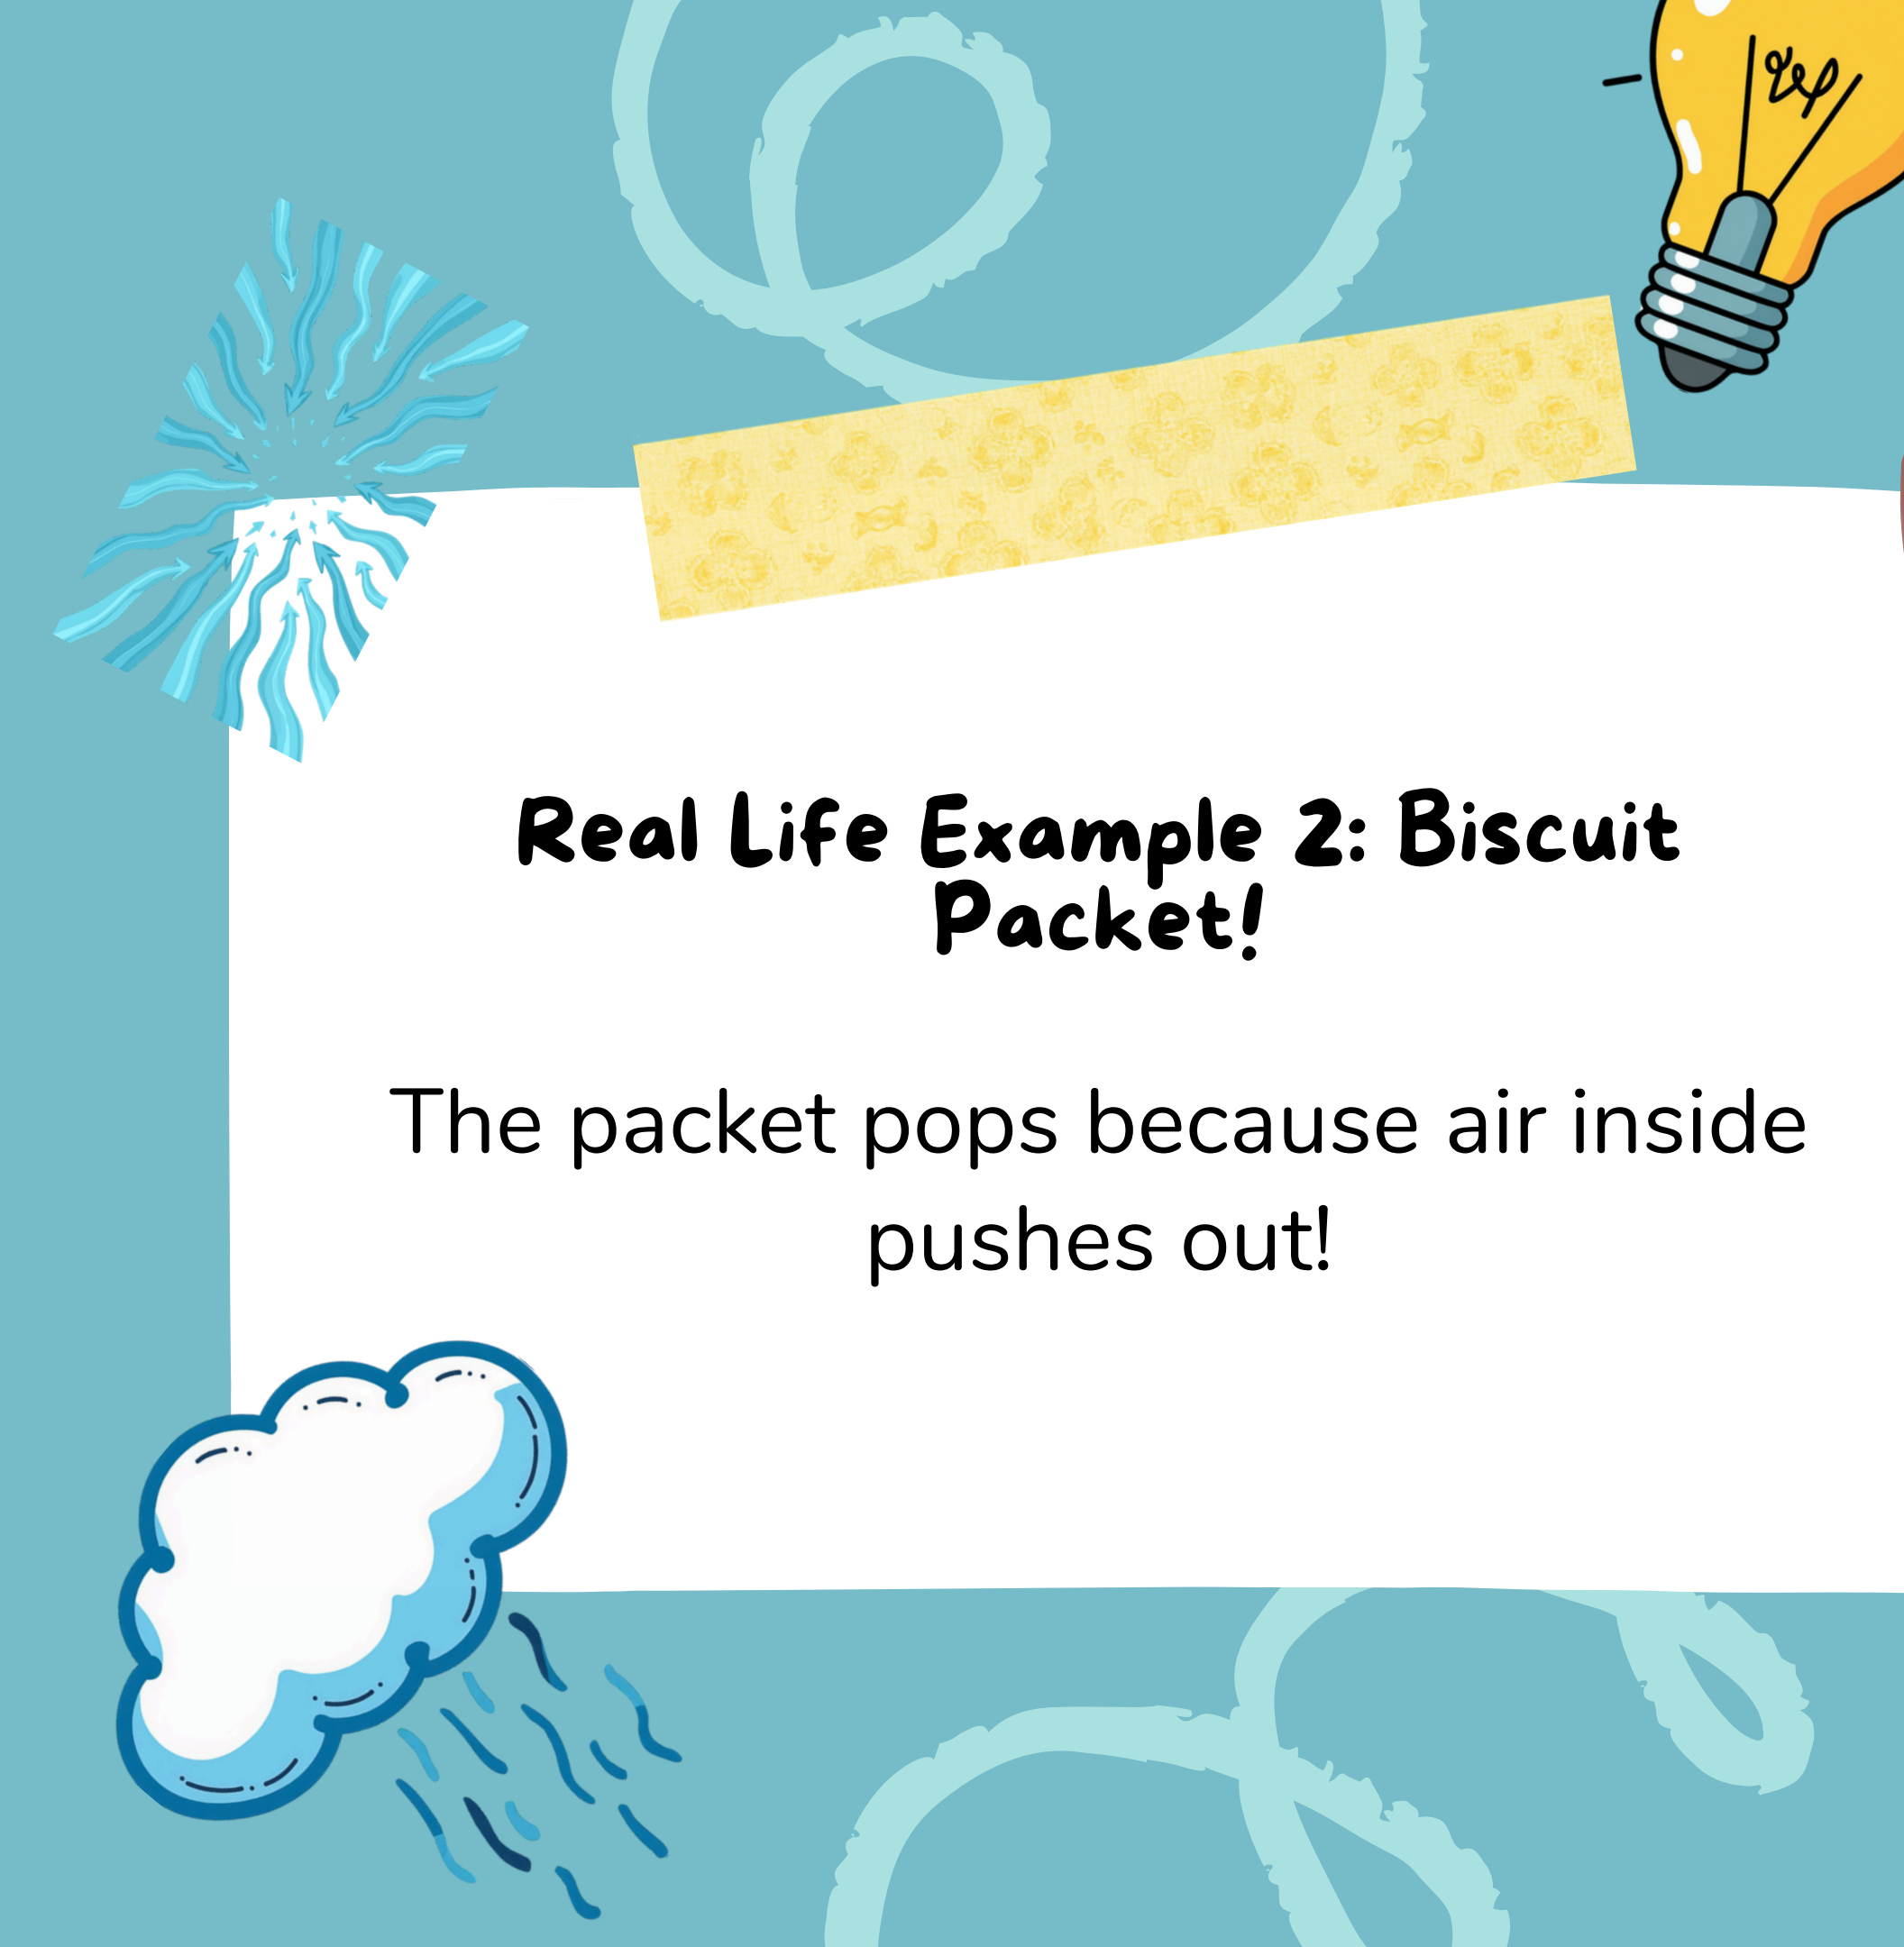

Real Life Example 1: Pressure Cooker Whistle

The whistle lets out pressure (Dabaav) so food cooks safely.

Real Life Example 2: Biscuit Packet!

The packet pops because air inside pushes out!

Steel Tiffin Dabba

The tiffin dabba stays strong because air pressure inside and outside is balanced (Santulan).

Real Life Example 4: Ears Popping on Mountain Trips

Ears pop because pressure changes
when we go up high!

Vocabulary: Important Words to Know

Pressure

Air

Crush

Push = Dhakka (धक्का)

Balance = Santulan (संतुलन)

**You Are a
Science
Detective!**

Great job exploring air pressure
today! Keep watching for our
next lesson to learn more
science secrets.

Coming Up Next!

Next time:
How does air
help balloons
fly?

Thank You!
