

Magnet Explorer

Session 1: Discovering the Magic of Magnets

The Invisible Force Awaits...

Magnet Explorer Series © 2024

The Magnet Mystery!

Remember Arjun's story? Arjun lost his sewing pin on the floor. Oh no! But clever Dadi had a magical idea—she used a magnet to find it!

What is a Magnet?

A magnet is a special object that has an invisible force called **magnetic force**.

This invisible force can pull some things toward it like magic! You cannot see it, but you can feel it working.

Let's Think:

- Have you ever felt a "tug" when bringing a magnet near a fridge?
- Why did the pin stick to Dadi's magnet but the floor did not?

Types of Magnets

Magnets come in many shapes and sizes, each useful for different jobs!

1. Bar Magnet

A long rectangular magnet you see in your classroom. Great for experiments!

2. Horseshoe Magnet

Shaped like a horseshoe! Very strong at picking up iron objects at its ends.

3. Fridge Magnet

Fun magnets on your refrigerator door at home! They hold notes and pictures.

4. Compass Needle

A tiny magnet inside that always points North to help us find direction!

What Do Magnets Attract?

Not everything is attracted to magnets. Let's sort the world!

Magnetic Materials (The "Yes" Group)

These materials contain metals that magnets love to pull:

- **Iron:** Safety pins, nails, and sewing pins.
- **Steel:** Tiffin dabba lids, and 5 rupee coins.
- **Nickel:** Some jewelry and coins.
- **Cobalt:** Special metal tools.

Non-Magnetic Materials (The "No" Group)

Magnets will NOT pull these items:

- **Wood:** Pencils.
- **Rubber/Plastic:** Rubber bands and erasers.
- **Specific Metals:** Aluminium, copper, and gold.

Prediction Time!

Before we test, let's act like real scientists and make a guess!

Object	My Guess (Will it stick?)	Observation (Did it stick?)
Sewing Pin		
Coin		
Eraser		
Paper Clip		
Wooden Pencil		

Scientist Note:

Watch carefully as the magnet pulls some objects closer! Notice which things stick and which don't move at all.

Magnetic Poles

Every magnet has two ends called poles: **North (N)** and **South (S)**.

Poles in Action!

ATTRACT!

When North meets South, they become best friends and pull together with a happy hug!

REPEL!

When North meets North or South meets South, they push away like they're saying "No thank you!"

REMEMBER: Opposite poles attract, same poles repel!

Summary: What Have We Learned?

- Magnets have an invisible magnetic force.
- They attract objects made of iron, steel, nickel, and cobalt.
- They do NOT attract wood, rubber, or gold.
- Every magnet has a North and South pole.
- Opposites Attract (N-S) and Likes Repel (N-N or S-S).

Quick Explorer Quiz

1. Which magnet is found in a classroom and is rectangular?

.....

2. If you put two North poles together, will they pull or push?

.....

3. Is a wooden pencil magnetic? Yes / No

.....

4. What part of the compass is a magnet?

.....

Great Job, Explorer!
