

THE QUIZ MASTER

BUILDING WITH
BLUEPRINTS

(Answer: Mango)

Imagine managing 100 questions one by one!

How would you keep track of so many questions and answers without getting confused?

WHY IS MANAGING QUESTIONS HARD?

HARD TO TRACK

With 100 questions, it's easy to lose track of which ones you've asked!

MESSY CODE

Writing the same code again and again makes everything confusing!

A SMARTER WAY?

What if we had a magic blueprint to create questions easily?

THE BLUEPRINT: RUBBER STAMP ANALOGY

A rubber stamp is like a Class – it's a design or blueprint that you create once.

Every time you press it, you get a real mark on paper – which is the Object!

One stamp design → Many ink marks!

Class = Stamp, Object = Mark!

+

CLASS VS OBJECT: UNDERSTANDING THE DIFFERENCE

Attributes are the information each object holds – like question text and its answer!

CLASS = BLUEPRINT

The idea or design template. Like a rubber stamp – it defines what something will look like!

OBJECT = REAL THING

The actual thing created from the class. Like ink marks made by pressing the stamp!

DEFINING OUR 'QUESTION' CLASS IN PYTHON

This is our blueprint for every quiz question!
A class is like a rubber stamp design that we can use again and again.

OUR BLUEPRINT CODE

```
class Question:
    def __init__(self, text, answer):
        self.text = text
        self.answer = answer
```

CREATING QUESTION OBJECTS

07

CODE EXAMPLE

```
q1 = Question("Capital of India?", "New Delhi")  
q2 = Question("IPL 2023 winner?", "CSK")  
q3 = Question("ISRO chief?", "Dr. S. Somanath")
```

08

RESULT

```
questions = [q1, q2, q3]  
Now we have 3 questions ready to play! 🎮
```

HOW THE QUIZ GAME WORKS

SHOW QUESTION TEXT

Display the question to the player on screen so they can read it.

GET ANSWER

Wait for the player to type their answer using `input()`.

CHECK & RESPOND

Compare answers and show "Correct! 🎉" or "Try again!"

CHECKING ANSWERS IN CODE

```
for question in questions:  
    user_answer = input(question.text + " ")  
  
    if user_answer.lower() == question.answer.lower():  
        print("Correct!")  
    else:  
        print("Incorrect. Try next question.")
```

INDIAN GK CHALLENGE!

QUESTION 1

What is the national fruit of India?
(Answer: Mango)

QUESTION 2

Which city is called the Silicon Valley of
India?
(Answer: Bengaluru)

QUESTION 3

Which Indian state is famous for
the Sun Temple?
(Answer: Odisha)

RECAP: WHAT DID WE LEARN TODAY?

11

CLASS = BLUEPRINT

A Class is a blueprint for creating objects.
Object is the real thing made from the class!

12

INIT METHOD

The **init** method sets up each object's information. We built a quiz game using question objects!

A QUOTE FROM YOUR CODE MENTOR

"Coding is like magic — you build your own world with simple blueprints!"

This is the power of programming. With just a few lines of code, you can create games, solve problems, and bring your ideas to life!

— Your friendly Code Mentor

THANK YOU!

Thank you for coding with us today!
Any questions? We'd love to hear from you.
