

LESSON SUMMARY: BE THE ROBOT!

Grade 1 Grid Quest | PlanRS Academy

1. What is a Robot?

A robot is a **machine** that listens and does exactly what we tell it! Unlike humans, robots cannot guess; they need exact instructions and clear steps to follow.

2. Basic Robot Commands

To move a robot, we use four fundamental commands:

MOVE FORWARD

MOVE BACKWARD

TURN LEFT

TURN RIGHT

Note: "Turn" means spinning to your side (left or right).

3. Programming & Sequencing

- **The Programmer:** The person who gives the instructions (like a teacher).
- **The Robot:** The one who follows instructions one step at a time.
- **Sequencing:** Commands must be placed in the **correct order** for the robot to reach its goal, such as reaching a "STAR" on a grid.

4. Debugging (Fixing Mistakes)

What is Debugging?

If a robot goes the wrong way, we check the steps to find the error. Finding and fixing these mistakes is called *debugging*.

5. Reflection Questions

- What commands do robots understand?
- Why do robots need exact instructions?
- How do we fix mistakes when a robot goes the wrong way?

Robo-Star Badge Earned!
