

Python Dictionaries – The Ultimate Digital Organizer

Fun Python for Young Coders!

The Smart Menu Card Mystery

Kabir walked into a restaurant and saw a menu card: Samosa – ₹20! How does the menu know which snack costs what? 🤔
"How does the menu show which snack costs what?"

Concept Discovery: Magic Pair-Up Diary

A Dictionary is like a Post Office locker cabinet!

- 🔑 Keys are the flat number labels
 - ✉️ Values are the letters stored inside
 - 📦 Dictionary holds all pairs together
- ```
my_dict = {"Flat1": "LetterA", "Flat2":
"LetterB"}
```

# Syntax Anchors: Packing the Tiffin Box!

```
cricket_scores = {"Virat": 82, "Rohit": 45}
{ } Curly brackets = tiffin bag · : Colon
ties label to item · , Comma separates
items
```

## Data Extraction: Kirana Store Shopping

```
print(cricket_scores["Virat"])
```

Just like calling "Maggi!" at the Kirana store and uncle fetches it directly — square brackets [ ] ask the dictionary for a value using the key name!

# Guided Code-Along: Festival Sweet Counter 🍬

```
sweet_box = {
 "Ladoo": 10,
 "Barfi": 15,
 "Jalebi": 20
}
print(sweet_box["Jalebi"])
```

Output: 20

Curly brackets hold all the sweets. Each sweet name is a key, and the number is its value. Use square brackets to fetch Jalebi's count!

# Bug Hunt: Lost Locker

## Key 🔍

Chulbul typed "mago" instead of "Mango" in his spice box!

```
spice_box = {"Mango": "sweet", "Chili": "hot"}
print(spice_box["mago"])
```

KeyError: 'mago'  
KeyError means: label not found! Check your spelling! 🤔

# Fixing KeyError: Check Your Label Carefully

- ✓ Always match the key spelling exactly!
  - ✓ Use only keys that exist in the dictionary.
  - ✓ Capital letters matter — "Mango" ≠ "mango"
- ```
spice_box = {"Mango": "sweet"}  
print(spice_box["Mango"]) # ✓ Works!
```

Eating Laddoos!

```
sweet_box["Ladoo"] = 5
```

Laddoos got eaten, so the count changed from 10 to 5! Dictionaries can be updated anytime — just use the key and assign a new value.

Recap: Your Magic Pair-Up Diary

- ★ Dictionaries store key-value pairs in { } curly brackets
- 🔑 Keys are labels; Values hold the data inside
- 🔍 Extract data using square brackets []
- ⚠️ Watch out for KeyError if the key is missing!
- ✏️ You can change values in a dictionary anytime!

Practice Challenge: Your Turn!

Create a dictionary for your favorite cricket players and their runs!

```
player_runs = {  
    "Virat": ____,  
    "Rohit": ____,  
    "Dhoni": ____  
}
```

Try it yourself and become a Data Master!

**"Learning to code is like learning
a new language to talk to
computers."**

Keep exploring, keep growing! ★

Congratulations!

You earned your Data Master Badge! 🏆
You have mastered Python Dictionaries –
key-value pairs, syntax, data extraction,
and KeyError handling. Keep exploring
and keep coding!
