

CSS – ANIMATIONS & TRANSITIONS

SPOT THE ANIMATION!

Swiggy Delivery

Google Doodle

Flipkart Button

WHAT IS ANIMATION?

Animation means making something MOVE or CHANGE or come ALIVE on a webpage — like cartoons on websites!

Think about things you see every day:

- A Diwali diya glowing and flickering
- A cricket ball flying across the screen
- The PhonePe green tick appearing
- Swiggy's loading animation

All of these are animations made with code!

THE MAGIC OF CSS

Animations are made using CODE — specifically CSS!

You don't need to draw anything. CSS does the magic for you!

CSS is like a magic wand that tells your website how things should look and move.

CSS TRANSITION – THE “SLOW CHANGE” TOOL

Traffic Signal

Sunrise Sky

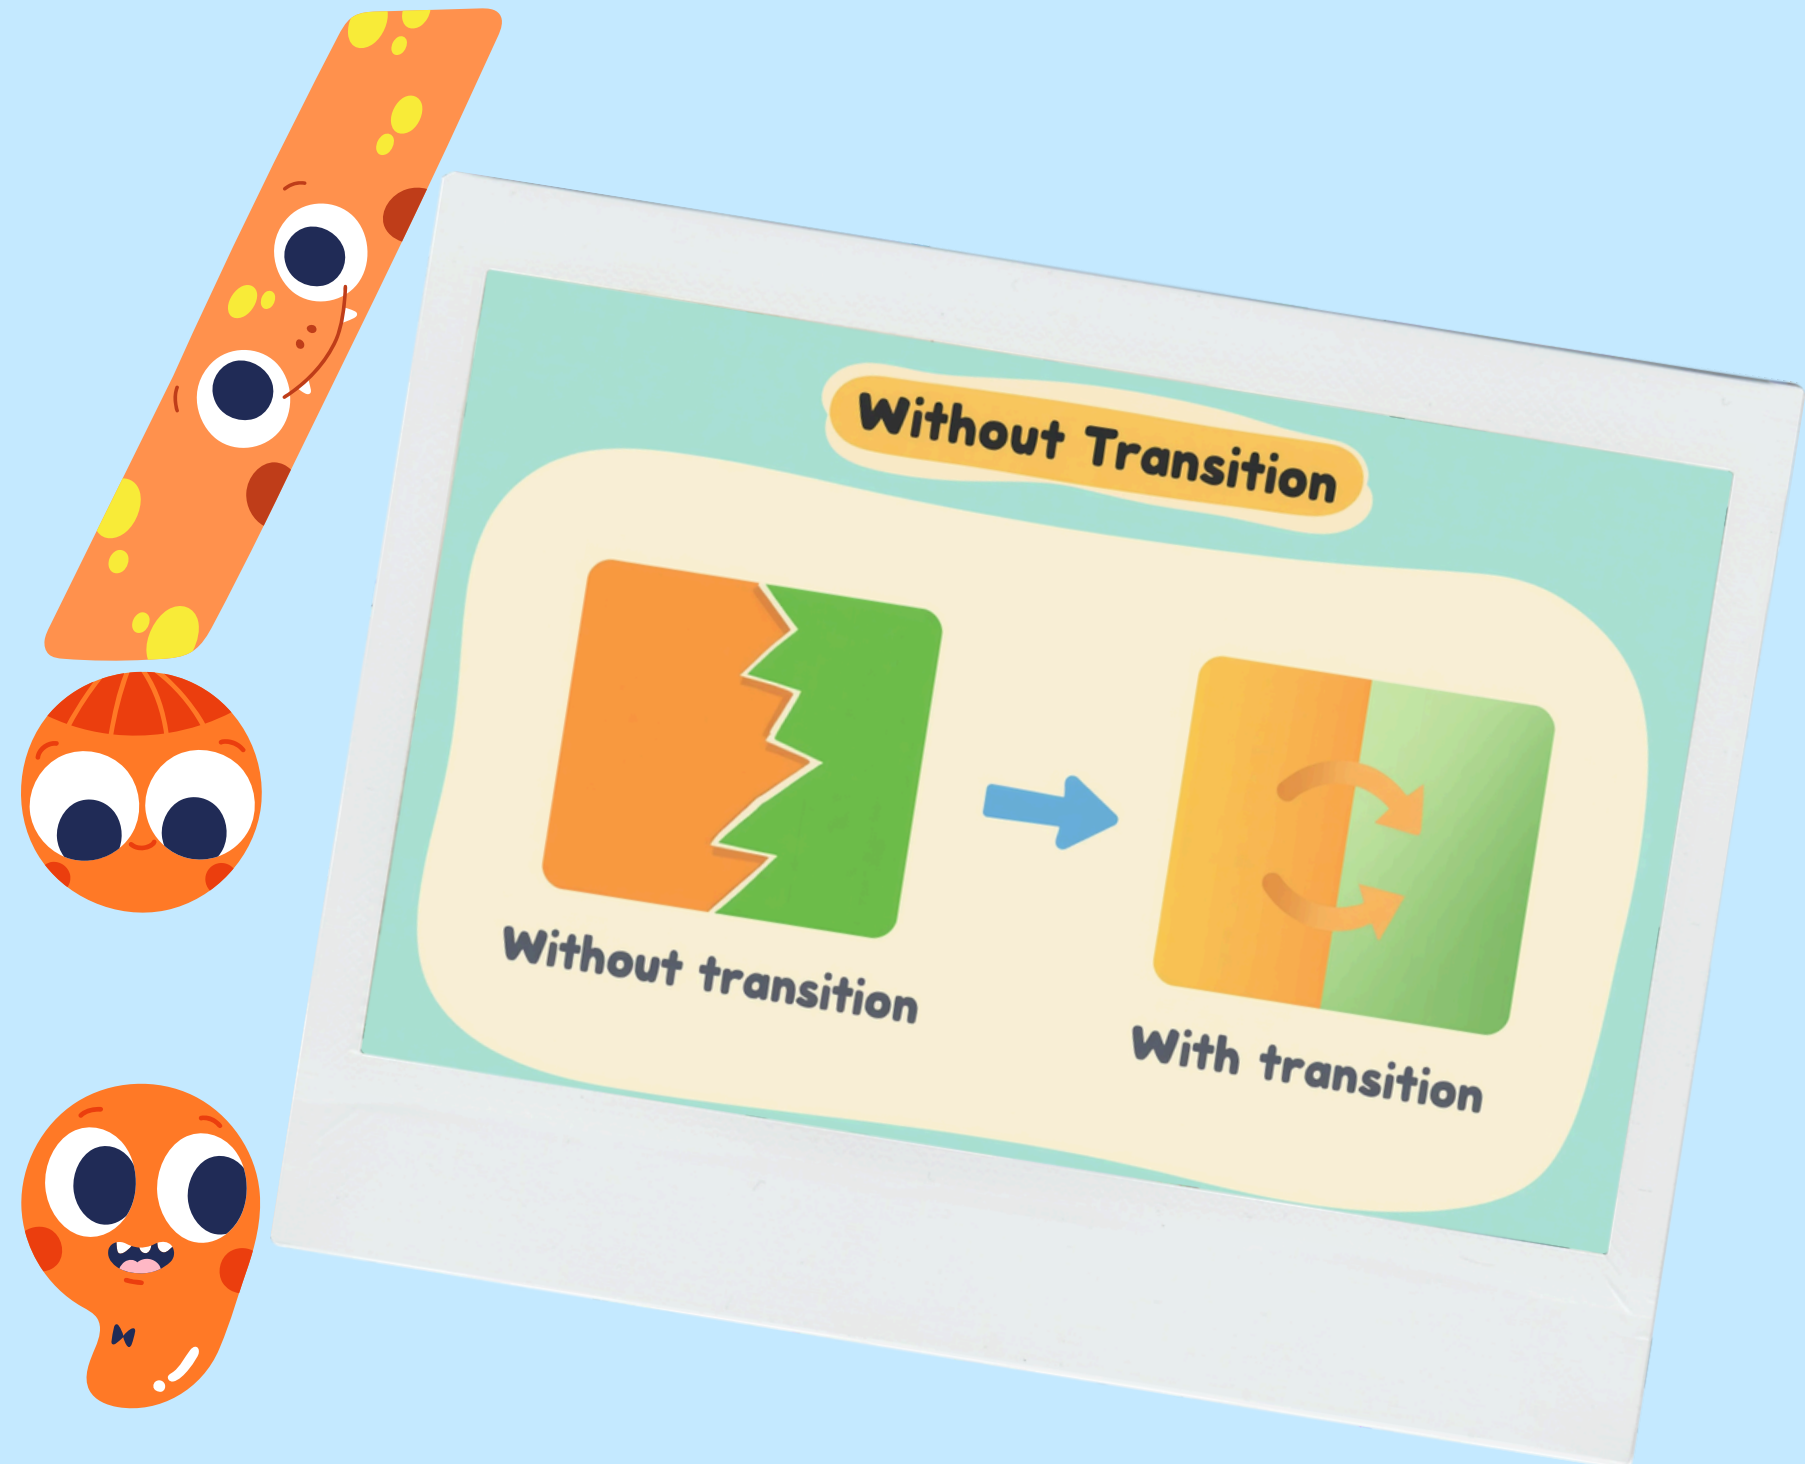

Smooth Change

CODE EXAMPLE – WITHOUT VS WITH TRANSITION

Let's compare two boxes!

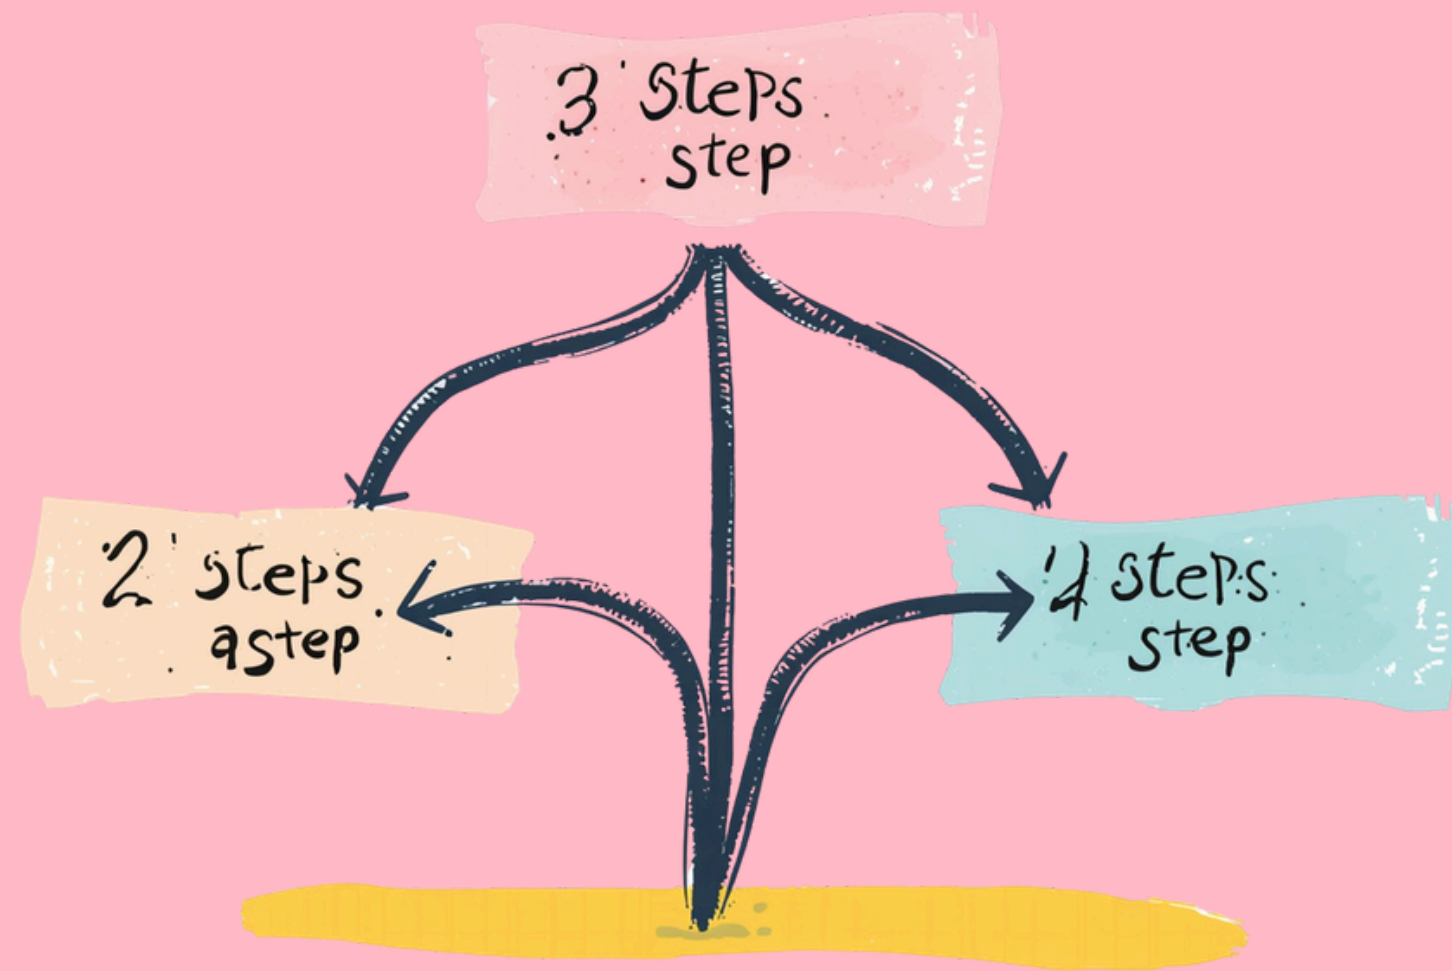

Without Transition: The box changes color INSTANTLY from orange to green — like a light switch!

With Transition: The box changes color SMOOTHLY from orange to green — like magic!
Which one looks better to you? The smooth one feels more natural, right?

THE TRANSITION PROPERTY

1

`.box { }` — This is the **SELECTOR**! It tells CSS which element to style.

2

`transition: background-color 1s;` — The **MAGIC LINE**! Change color and take 1 second to do it.

3

`.box:hover { }` — The **TRIGGER**! When you hover your mouse, the smooth change begins!

THE :HOVER TRIGGER

:hover means "when I touch it" with my mouse cursor!

Think of it like a motion-sensor light in a shopping mall. When you walk under it, the light turns ON. When you walk away, it turns OFF. Same with :hover — when your mouse goes over a button, the CSS magic starts. When you move away, it goes back to normal!

DURATION - HOW FAST OR SLOW?

1

0.5s = FAST ⚡ Like a quick blink! The change happens super speedy.

2

1s = MEDIUM 🕒 Just right! A comfortable, smooth change you can see clearly.

3

3s = SLOW 🐢 Like watching sunrise! The change happens very gradually.

HANDS-ON TIME!

1

MUST DO: Make your box change color smoothly on hover using transition!

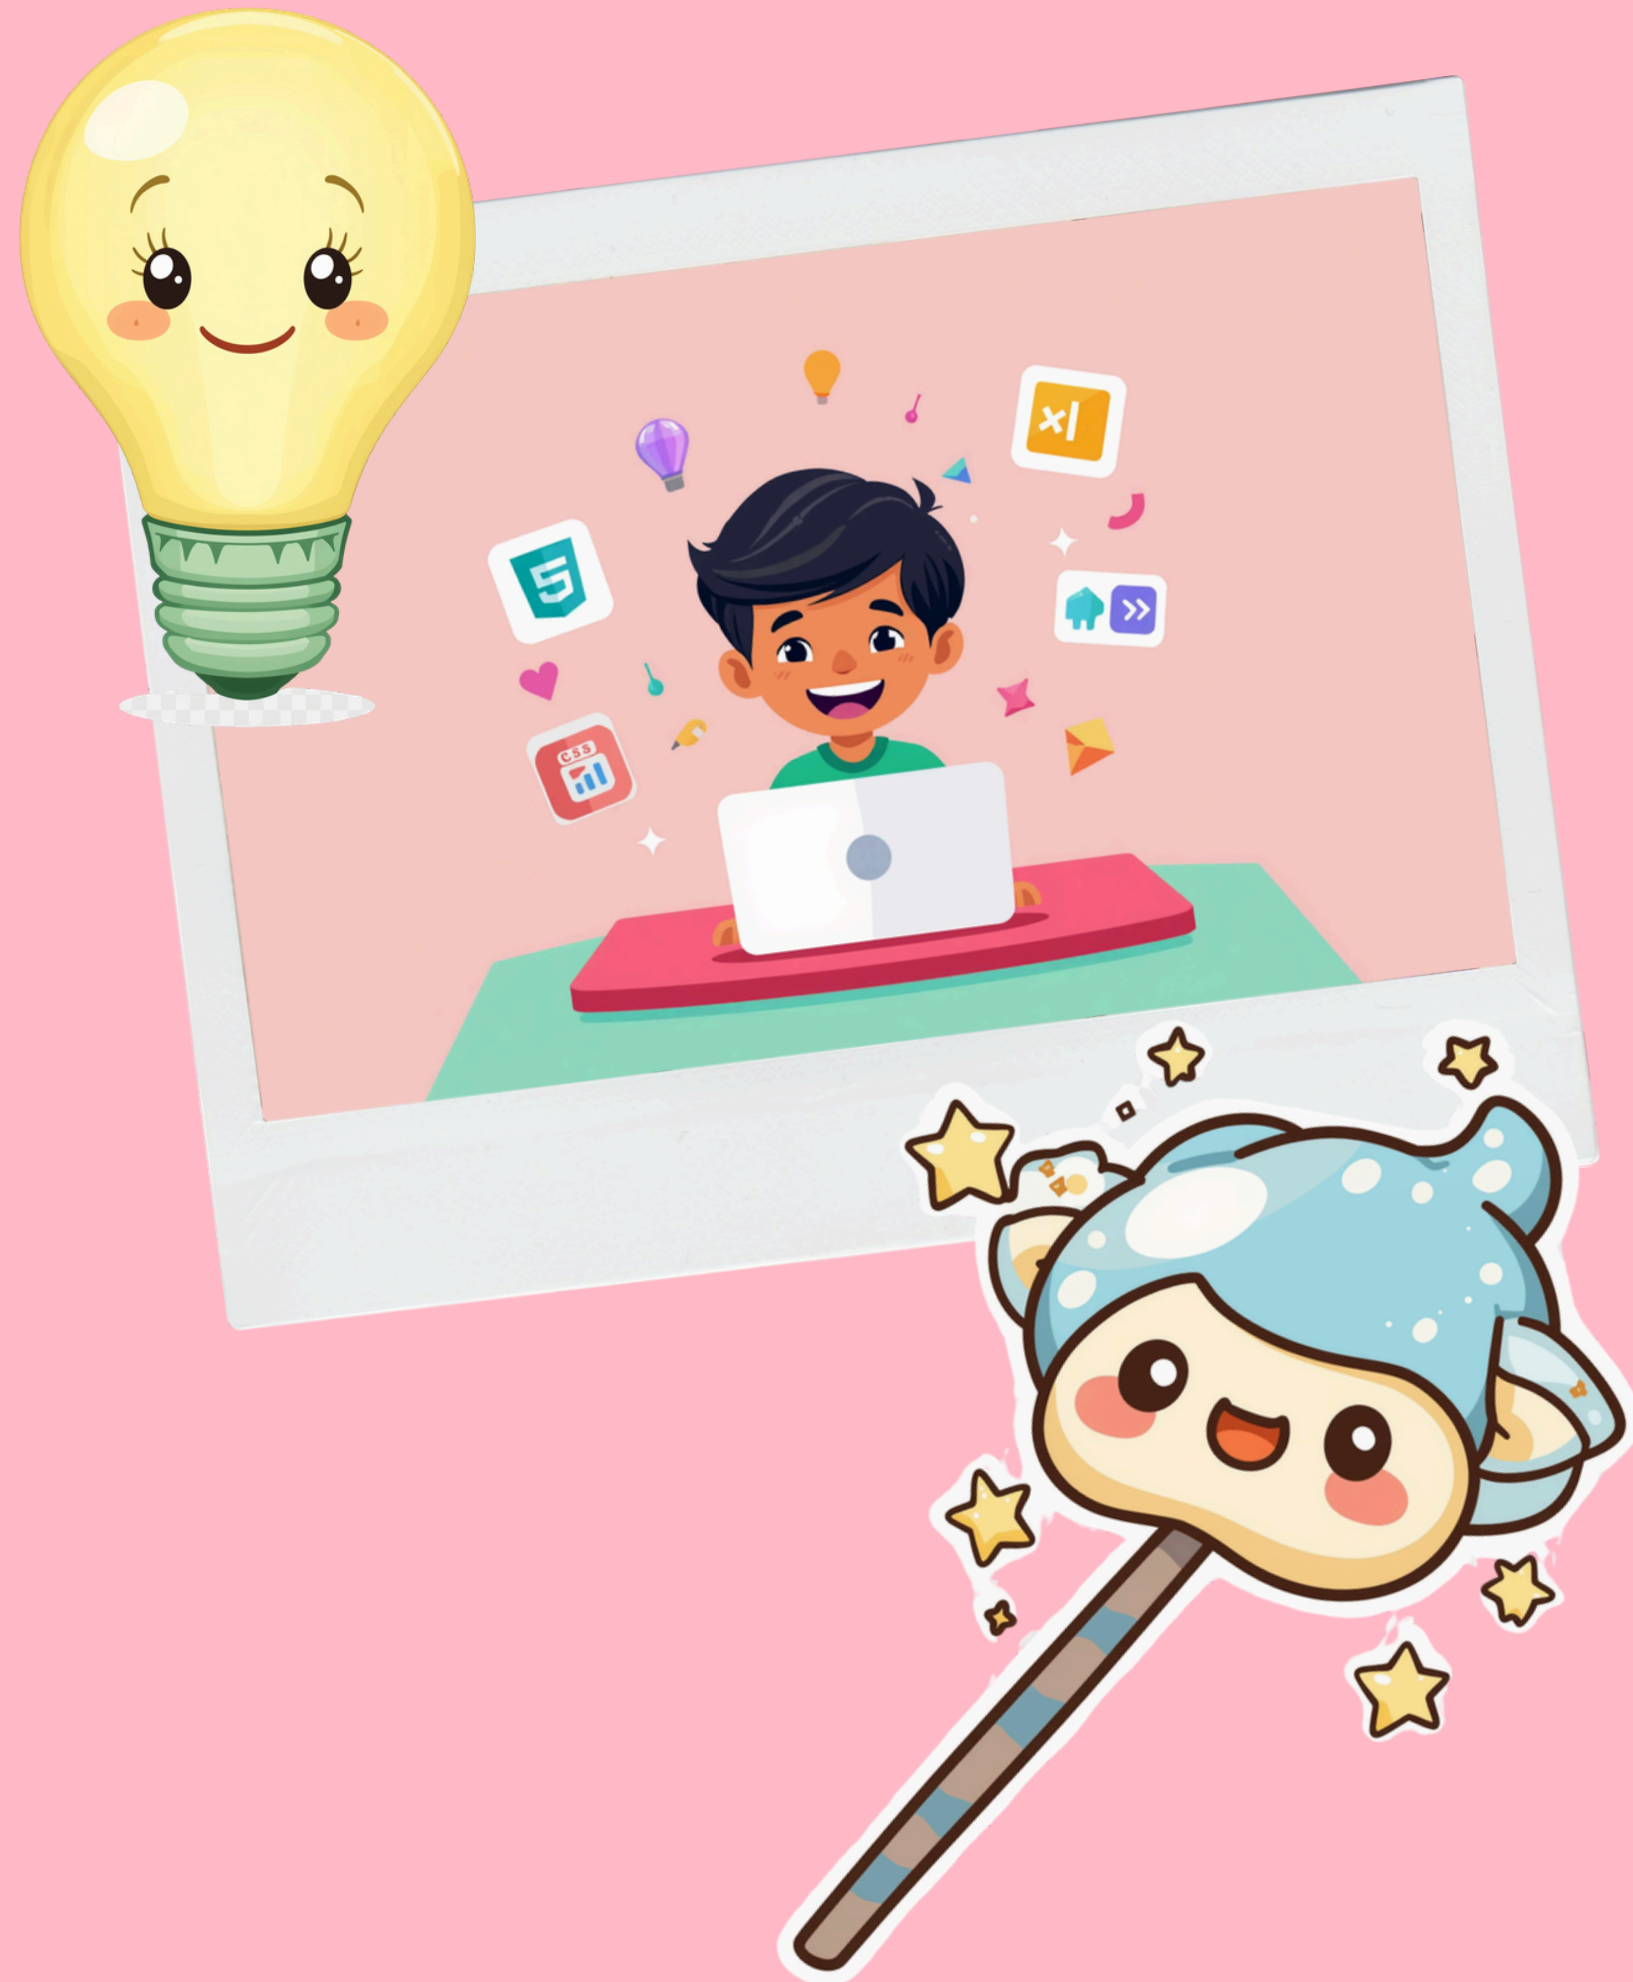

2

SHOULD DO: Try different durations — 0.3s (fast), 1s (medium), 3s (slow)!

3

STRETCH: Make the box grow using transform: scale(1.3) on hover!

KEY PARTS RECAP

1

transition: [what to change] [how long]
Example: background-color 1s

2

Properties you can change: background-color, width, height, font-size, border-radius

3

You control how fast the magic happens! Try different speeds!

WHAT WE LEARNED TODAY

1

CSS Transition makes changes slow and smooth — no more instant jumps!

2

`:hover` triggers the transition when your mouse touches an element!

3

Duration controls speed — use 0.5s, 1s, or 3s to set how fast!

COMING UP NEXT

Next session: CSS ANIMATIONS — things move all by themselves!

Get ready to learn the magic of @keyframes!

Examples we'll create:

- Star twinkling in the night sky
- Diwali diya flickering with light
- Elements that animate without hovering!

Your code will come alive on its own!

HOMEWORK CHALLENGE

1

Make a button that changes color AND size smoothly on hover — use transition property!

2

BONUS: Change border-radius from square to circle (try border-radius: 50%)

3

Show your family what you created! Explain how YOUR code made the magic happen!

**YOU'RE A CSS
ANIMATOR now!**
