

EYES OF THE

MACHINE

HOW AI SEES THE WORLD

The AI Eye Test

Can you spot what this is before the AI
does?

Look at the blurry image and guess what
famous landmark is hiding! Think fast — the
AI is watching too!

What is Computer Vision?

Computer Vision is how machines learn to 'see' and 'understand' pictures — just like your eyes!

AI looks at images and finds patterns, breaking pictures into tiny dots called pixels to understand what it sees.

Bounding Boxes

The Machine's Highlighter

Bounding Boxes are colored rectangles that AI draws around objects it finds in images. Just like you use a highlighter to mark important words, AI uses bright boxes to show "I found something here!" Each box surrounds one object — like a rickshaw, cycle, or even a cow on the street!

Classification vs. Detection

Classification

"What is it?"
This is a Mango.
AI identifies the object
in the image.

Detection

"Where is it?"
There are 5 Mangoes
here, and AI shows
each location.

Key Difference

Classification names
objects. Detection finds
AND locates them with
bounding boxes!

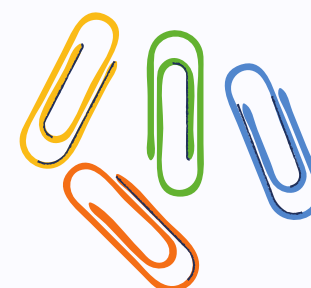

Confidence Scores

Confidence Score tells how sure AI is about what it sees. Think of it like a test score — higher percentage means the AI is more certain about its answer!

- ✔ Samosa detected with 95% confidence — AI is very sure!
- ✔ Kachori detected with 60% confidence — AI is less certain.

03 % 45 35 %

Interactive Demo: Indian Kitchen

AI object detection in a familiar environment!
Look at this typical Indian kitchen counter
and see what the machine's eyes can find.

Can you spot what the AI finds here? Notice
the neon bounding boxes around each
object with labels and confidence scores!

How AI Helps on Indian Roads

AI detects Rickshaws, Cycles, and Cows to keep roads safe!

Traffic cameras and systems like Fastag use computer vision to spot different vehicles and animals on busy streets. This helps manage traffic flow and prevents accidents.

The AI draws bright bounding boxes around each object it finds, helping keep everyone safer on the road.

AI in Indian Agriculture Smart Farming

AI helps farmers by detecting ripe and unripe Alphonso mangoes using computer vision and bounding boxes.

This helps farmers pick the right fruit at the right time, reducing waste and increasing profits!

Counting Crowds at Festivals

AI counts people at Melas and festivals to help manage crowds safely and plan better arrangements.

Bounding boxes around groups help organizers know how many people are in each area — keeping everyone safe!

Can You

Spot the Error?

Look carefully at the image! The AI has drawn bounding boxes around objects it detected. But wait... something doesn't look right! Can you find the mistake the AI made?

- ✔ Did the AI get it right? What's wrong here?
- ✔ Why do you think AI might get confused sometimes?

Recap:

What We Learned Today

Computer Vision

Machines can "see" and understand images just like our eyes do!

Bounding Boxes

Colorful rectangles that show WHERE objects are in a picture.

Confidence Scores

Numbers that tell HOW SURE the AI is about what it sees.

Your Turn: Imagine AI's Eyes

Where else in India could AI's eyes help people? Think about your school, your neighbourhood, or places you visit. What could computer vision detect and help with? Share your creative ideas!

THANK YOU!
