

Building Your Choice Adventure!

Learn how to make paths in code using "If" and "Else"

The Story: The Lost Key of Ajanta Caves

Meet **Ananya** and her cousin **Kabir**! They are exploring ancient garden ruins near an old fort. While pulling away thick ivy leaves, their hands touch a cold, heavy iron door! The door has two glowing symbols carved into it.

To figure out what is behind the heavy door safely, Kabir pulls out his laptop to build a **text adventure game**. This game will let them test different paths using code!

How Code Makes Decisions

In programming, we can make our code choose different paths based on a player's answer. We call this an **If-Else structure**. Think of it just like a fork in a real walking trail:

```
IF the left path is open:  
    Walk to the beautiful waterfall!  
ELSE:  
    Walk to the ancient temple ruins instead!
```

Notice how you can only pick one path at a time! If you go to the waterfall, you skip the temple. If the left path is blocked, you automatically take the alternative trail to the temple.

Our Coding Tools

- **print()** → This is your code's megaphone! It displays text on the screen so the player can read what is happening in the story.
- **input()** → This stops the game and waits for the player to type in an answer or choice.

Let's Read the Adventure Code!

Look at how we put these parts together to build our game loop:

```
print("You see a dark cave entrance!")
choice = input("Do you go left or right? ")

if choice == "left":
    print("Yay! You found a chest full of treasure!")
else:
    print("Oh no! A sleepy dragon wakes up!")
```

Page 2: Code Challenges & Game Studio

Question 1: Which coding tool do we use to pause our game and wait for the player to type an answer?

- ☐ print()
- ☐ input()
- ☐ if

Question 2: What punctuation symbol must ALWAYS go at the end of an if or else line to show a path is starting?

- ☐ Comma (,)
- ☐ Semicolon (;)
- ☐ Colon (:)

Question 3: Imagine you want to add a third choice to the game! If the player types "secret_passage", what should happen? Write your own creative story outcome below:

Question 4: Rearrange these code pieces in the boxes below from first to last to make a proper question and path choice cycle:

[else]

[input()]

[if]

[print()]

Your Turn: The Dinner Path Challenge!

We use If-Else logic every single day without realizing it! Think about your dinner choices tonight and fill out the blank paths below:

IF we have pizza for dinner tonight:

I will eat: _____

ELSE:

I will eat: _____

Awesome Job, Future Programmer!

You now know exactly how computers make choices! Keep exploring, writing stories, and building cool games!
