

MY DYNAMIC DIGITAL FESTIVAL CARD

A Fun Coding Adventure for Kids!

Grade 3 Coding Lesson Guide

**Let's build a glowing, beautiful Diwali
card using real computer code!**

Welcome, Young Creator!

Get ready to build something truly magical today! ✨

We are going to make our very own **Glowing Digital Diwali Card** on the computer. We will use three magic tools called **HTML**, **CSS**, and **JavaScript**.

Your finished digital card will be able to do awesome things:

- ✨ It will **light up** brightly on your screen!
- 📧 It will show a **special festive message**.
- 🎆 It will sparkle with bright colors—just like real Diwali fireworks!

By the end of this lesson, you will have a beautiful, interactive card that you can show and share with your family and best friends!

Our Goal Today:

To learn how web pages are made and become a proud website creator! Let's get started!

Our Digital Crafting Toolbox

Building a web page is just like making fun festival decorations! We use three special tools, and each one has a very important job:

1. HTML is like a Kite Frame (Patang)

HTML builds the **structure** and shape of your card. It holds your words and pictures in place so they don't fall decoration-flat!

2. CSS is like Rangoli Colors

CSS makes your card look **bright and beautiful**! You use it to paint your background and choose pretty colors for your text.

3. JavaScript (JS) is like a Fairy Lights Switch

JavaScript makes your card **come alive with magic**! When you click a button, JavaScript turns on the lights and shows surprise messages.

Just like a festival needs a frame, beautiful colors, and lights, our digital card needs all three tools!

Step 1: Building the Kite Frame (HTML)

Let's start by giving our card its shape using **HTML**. In HTML, we use things called **tags** to add headings and text. Tags look like little pockets with angle brackets: `<heading>`.

Look at this code that sets up our greeting title:

```
<heading>Happy Diwali from Aarav!</heading>
```

Try It Yourself Activity:

Let's change the name on the card to your own name! Replace **"Aarav"** with your name.

If your name is Tanya, your code will look like this:

```
<heading>Happy Diwali from Tanya!</heading>
```

Watch Out for the Typo Spider!

Always remember to close your tags correctly with a forward slash /. If you forget, your code might get caught in a spiderweb!

Step 2: Painting Your Card (CSS)

Now that our card has a frame, it is time to make it colorful! We will use **CSS** to paint the background, just like filling a beautiful Rangoli design.

To change the color of the whole card page, we tell the computer to change the background-color of the **body**.

Pick Your Favorite Festive Shade!

Which background color do you want for your festival card? Choose one code block below and use it:

- ✨ **Gold:** Beautiful like glowing festive lights!

```
body { background-color: gold; }
```

- ❤️ **Crimson:** A rich, bright celebratory red!

```
body { background-color: crimson; }
```

- 🍊 **Orange:** Warm and cheerful like marigold flowers!

```
body { background-color: orange; }
```

Block 1 Wrap-Up: You Are Doing Great!

Look at what you have built so far! ✨

Let's check our checklist to see how much we have coded:

✓ **The HTML Kite Frame:** You gave your Diwali card a proud title using a heading tag, and you customized it with your very own name!

✓ **The CSS Rangoli Colors:** You painted your card background bright with a beautiful festive shade—either gold, crimson, or orange!

Your card is already glowing with festive spirit! You are doing amazing work, young web crafter!

Break Time & Bug Hunt!

When computer programmers make a tiny mistake in their code, they call it a **"bug"**. Let's look for a sneaky typo spider hiding in this HTML code below!

Can you find the mistake in this heading tag?

```
<heading>Happy Diwali!</heading
```

Need a Hint?

Look closely at the very end of the line. Remember, every single tag needs an opening bracket `<` AND a closing bracket `>` to lock the code safely inside!

Did You Find It?

You got it! The closing tag is missing its `>` symbol at the end. To fix it, we write: `</heading>`. Great job, Detective!

Step 3: Flick the Fairy Lights Switch!

Our card has a frame and beautiful colors, but it needs action! We want a button that triggers a magic surprise. This is where we use **JavaScript (JS)** magic.

We are going to add an interactive button to our card. When someone clicks it, the card comes alive!

⚡ Add the Magic Button Code:

Add this magic action line to your card project:

```
Run the magic!
```

When a user clicks this button, the JavaScript switch flips and makes a beautiful celebratory greeting pop up on the screen!

✨ **Snap! Just like that, your card is officially interactive!** ✨

Customize Your Card!

Now it's your turn to make your Diwali card truly one-of-a-kind!

Use your awesome creativity to make your card shine extra bright. Here are three super fun ideas you can try right now:

1. Change the Greetings:

Write your own personal wish inside the HTML tags! Instead of "Happy Diwali", you can write "Wishing you a sparkling Diwali!" or "Have a joyful festival!"

2. Mix and Match Colors:

Try changing your text color to contrast beautifully with your background. If your background is gold, try making your text crimson!

3. Add Festive Symbols & Emojis:

Make your card super joyful by adding fun emojis like clay lamps () , bright fireworks () , and shining stars () directly into your text!

Show & Tell Time!

You did it! You are a certified Web Creator now! 

You have successfully coded your very own **Dynamic Digital Festival Card** using real HTML, CSS, and JavaScript. That is a huge achievement!

Share Your Magic Creation

Now it's time to share your amazing creation with the people you love. Open your glowing digital card and show it to your mom, dad, siblings, and friends!

Tell them exactly how you coded the frame, painted the colors, and added the fairy light magic switches! 

Thank You & Happy Diwali!
