

Heat Transfer – Conduction Demo

Ouch! Why Did It Get Hot?

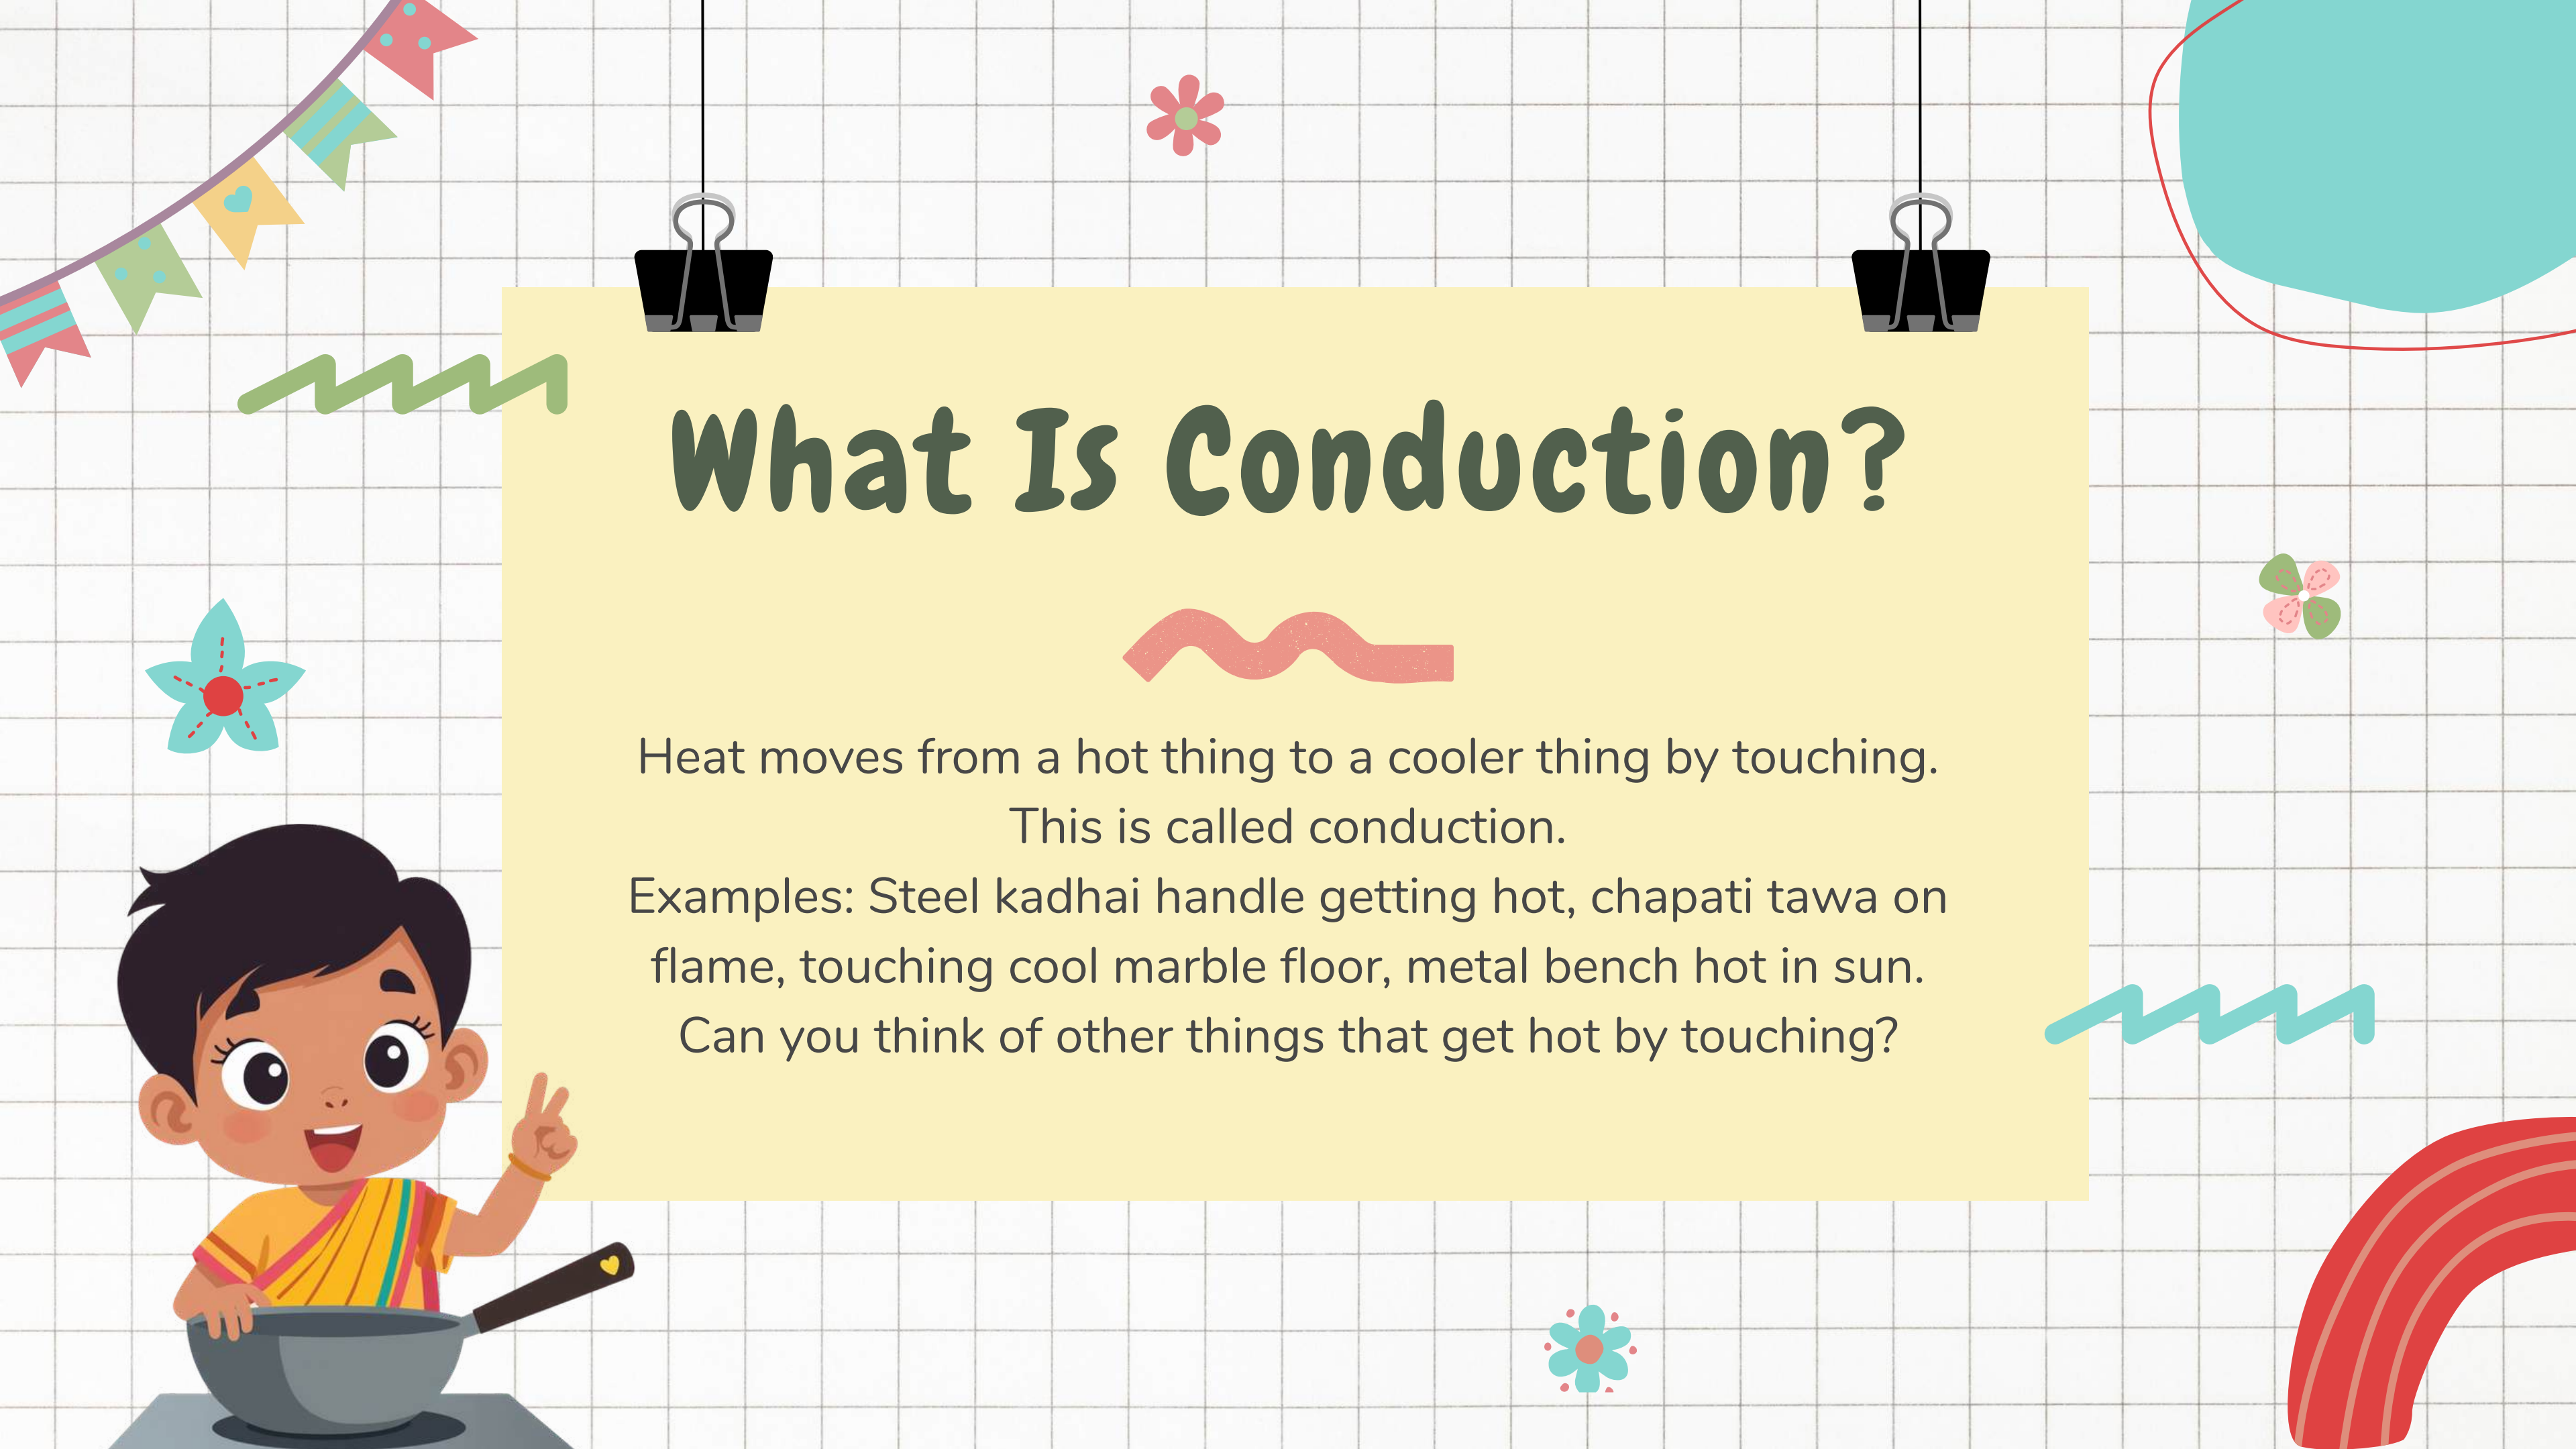

Riya touched the steel vessel and said,
"Ouch! Why did it get hot?"
Have you ever felt something hot by
touching it?

What Is Heat?

Heat is energy that makes things feel warm or hot. Think about the sun warming the terrace, hot chai in a steel glass, or feeling cozy near a sigri (clay fire pot)!

What Is Conduction?

Heat moves from a hot thing to a cooler thing by touching.
This is called conduction.

Examples: Steel kadhai handle getting hot, chapati tawa on flame, touching cool marble floor, metal bench hot in sun.

Can you think of other things that get hot by touching?

The background is a light orange color with faint, hand-drawn sketches of various kitchen items like spoons, ladles, and bowls. A blue rectangular box is centered on the page, held by two black binder clips at the top. To the left of the box, a string of colorful triangular flags hangs down. A green zigzag line is on the left side of the box, and a red rainbow is on the bottom right. A small pink flower is at the top center, and a small green flower is on the right side of the box.

Meet Our Friends: Meera & Lakdi Bhai

Meera the Metal Spoon loves to carry heat quickly. Lakdi Bhai the Wooden Ladle keeps things cool!
Metal is a good heat carrier. Wood is not.
Let's listen to their stories!

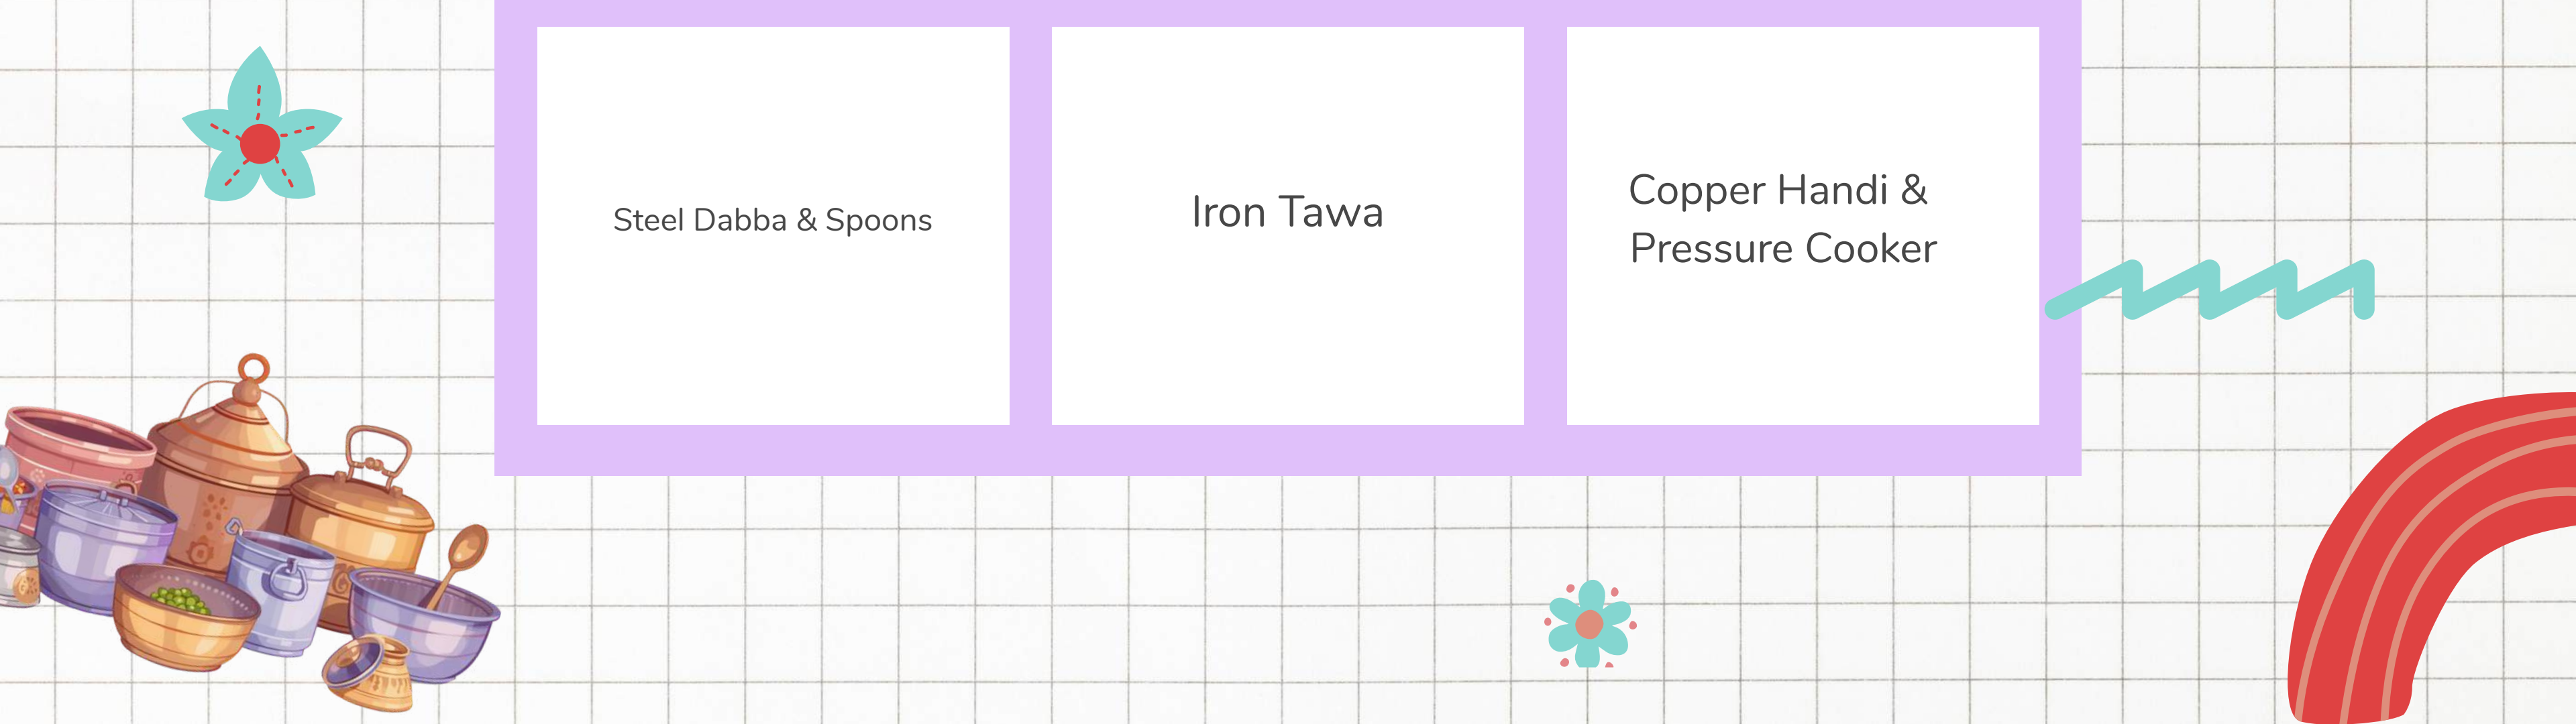

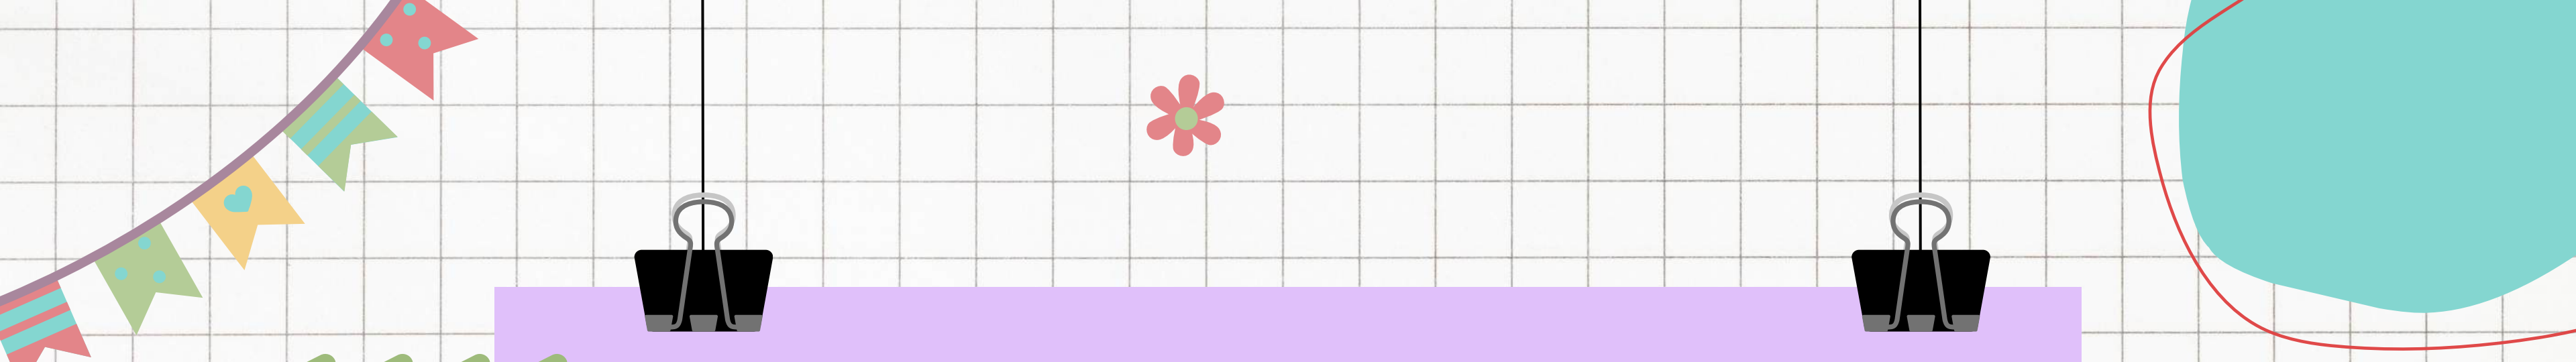

Conductors – Heat Carriers

Steel Dabba & Spoons

Iron Tawa

Copper Handi &
Pressure Cooker

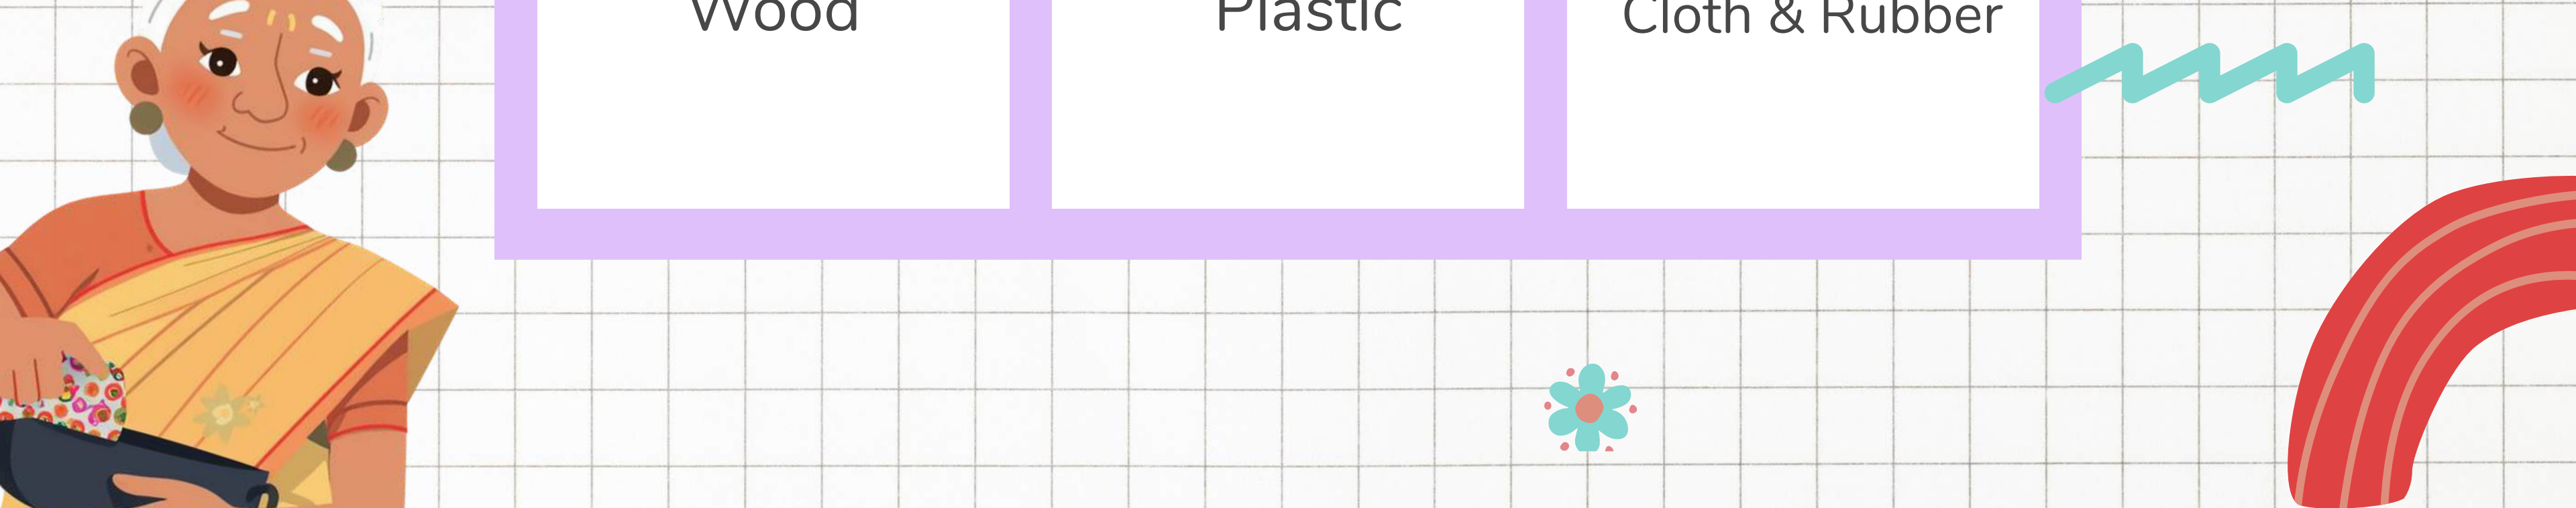

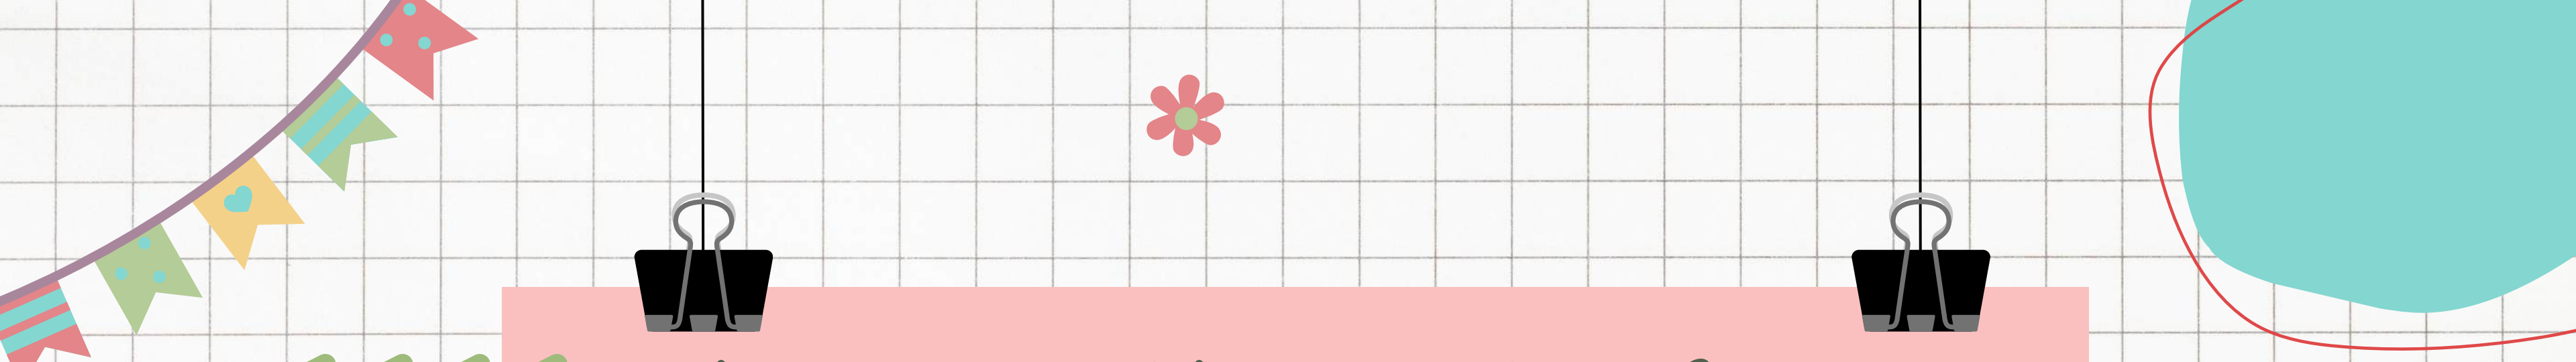

Insulators – Slowing Heat Down

Wood

Plastic

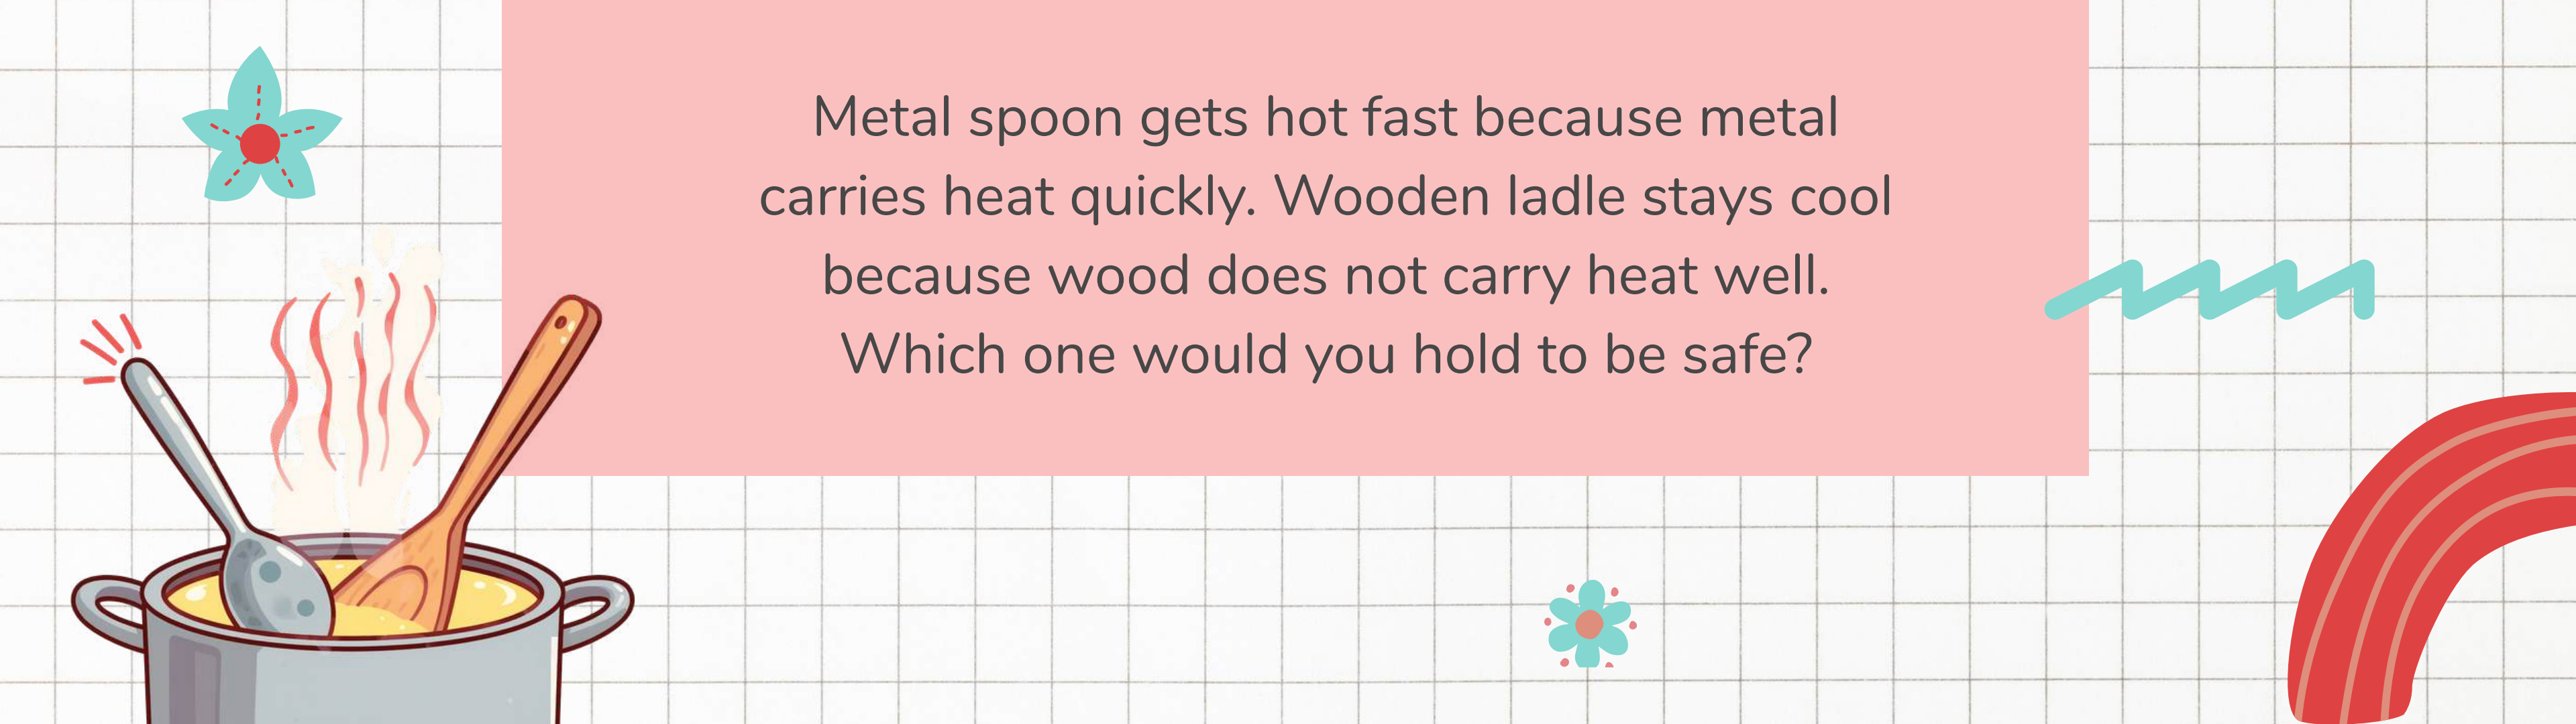

Cloth & Rubber

Why Does the Metal Spoon Get Hot but Not the Wooden Ladle?

Metal spoon gets hot fast because metal carries heat quickly. Wooden ladle stays cool because wood does not carry heat well. Which one would you hold to be safe?

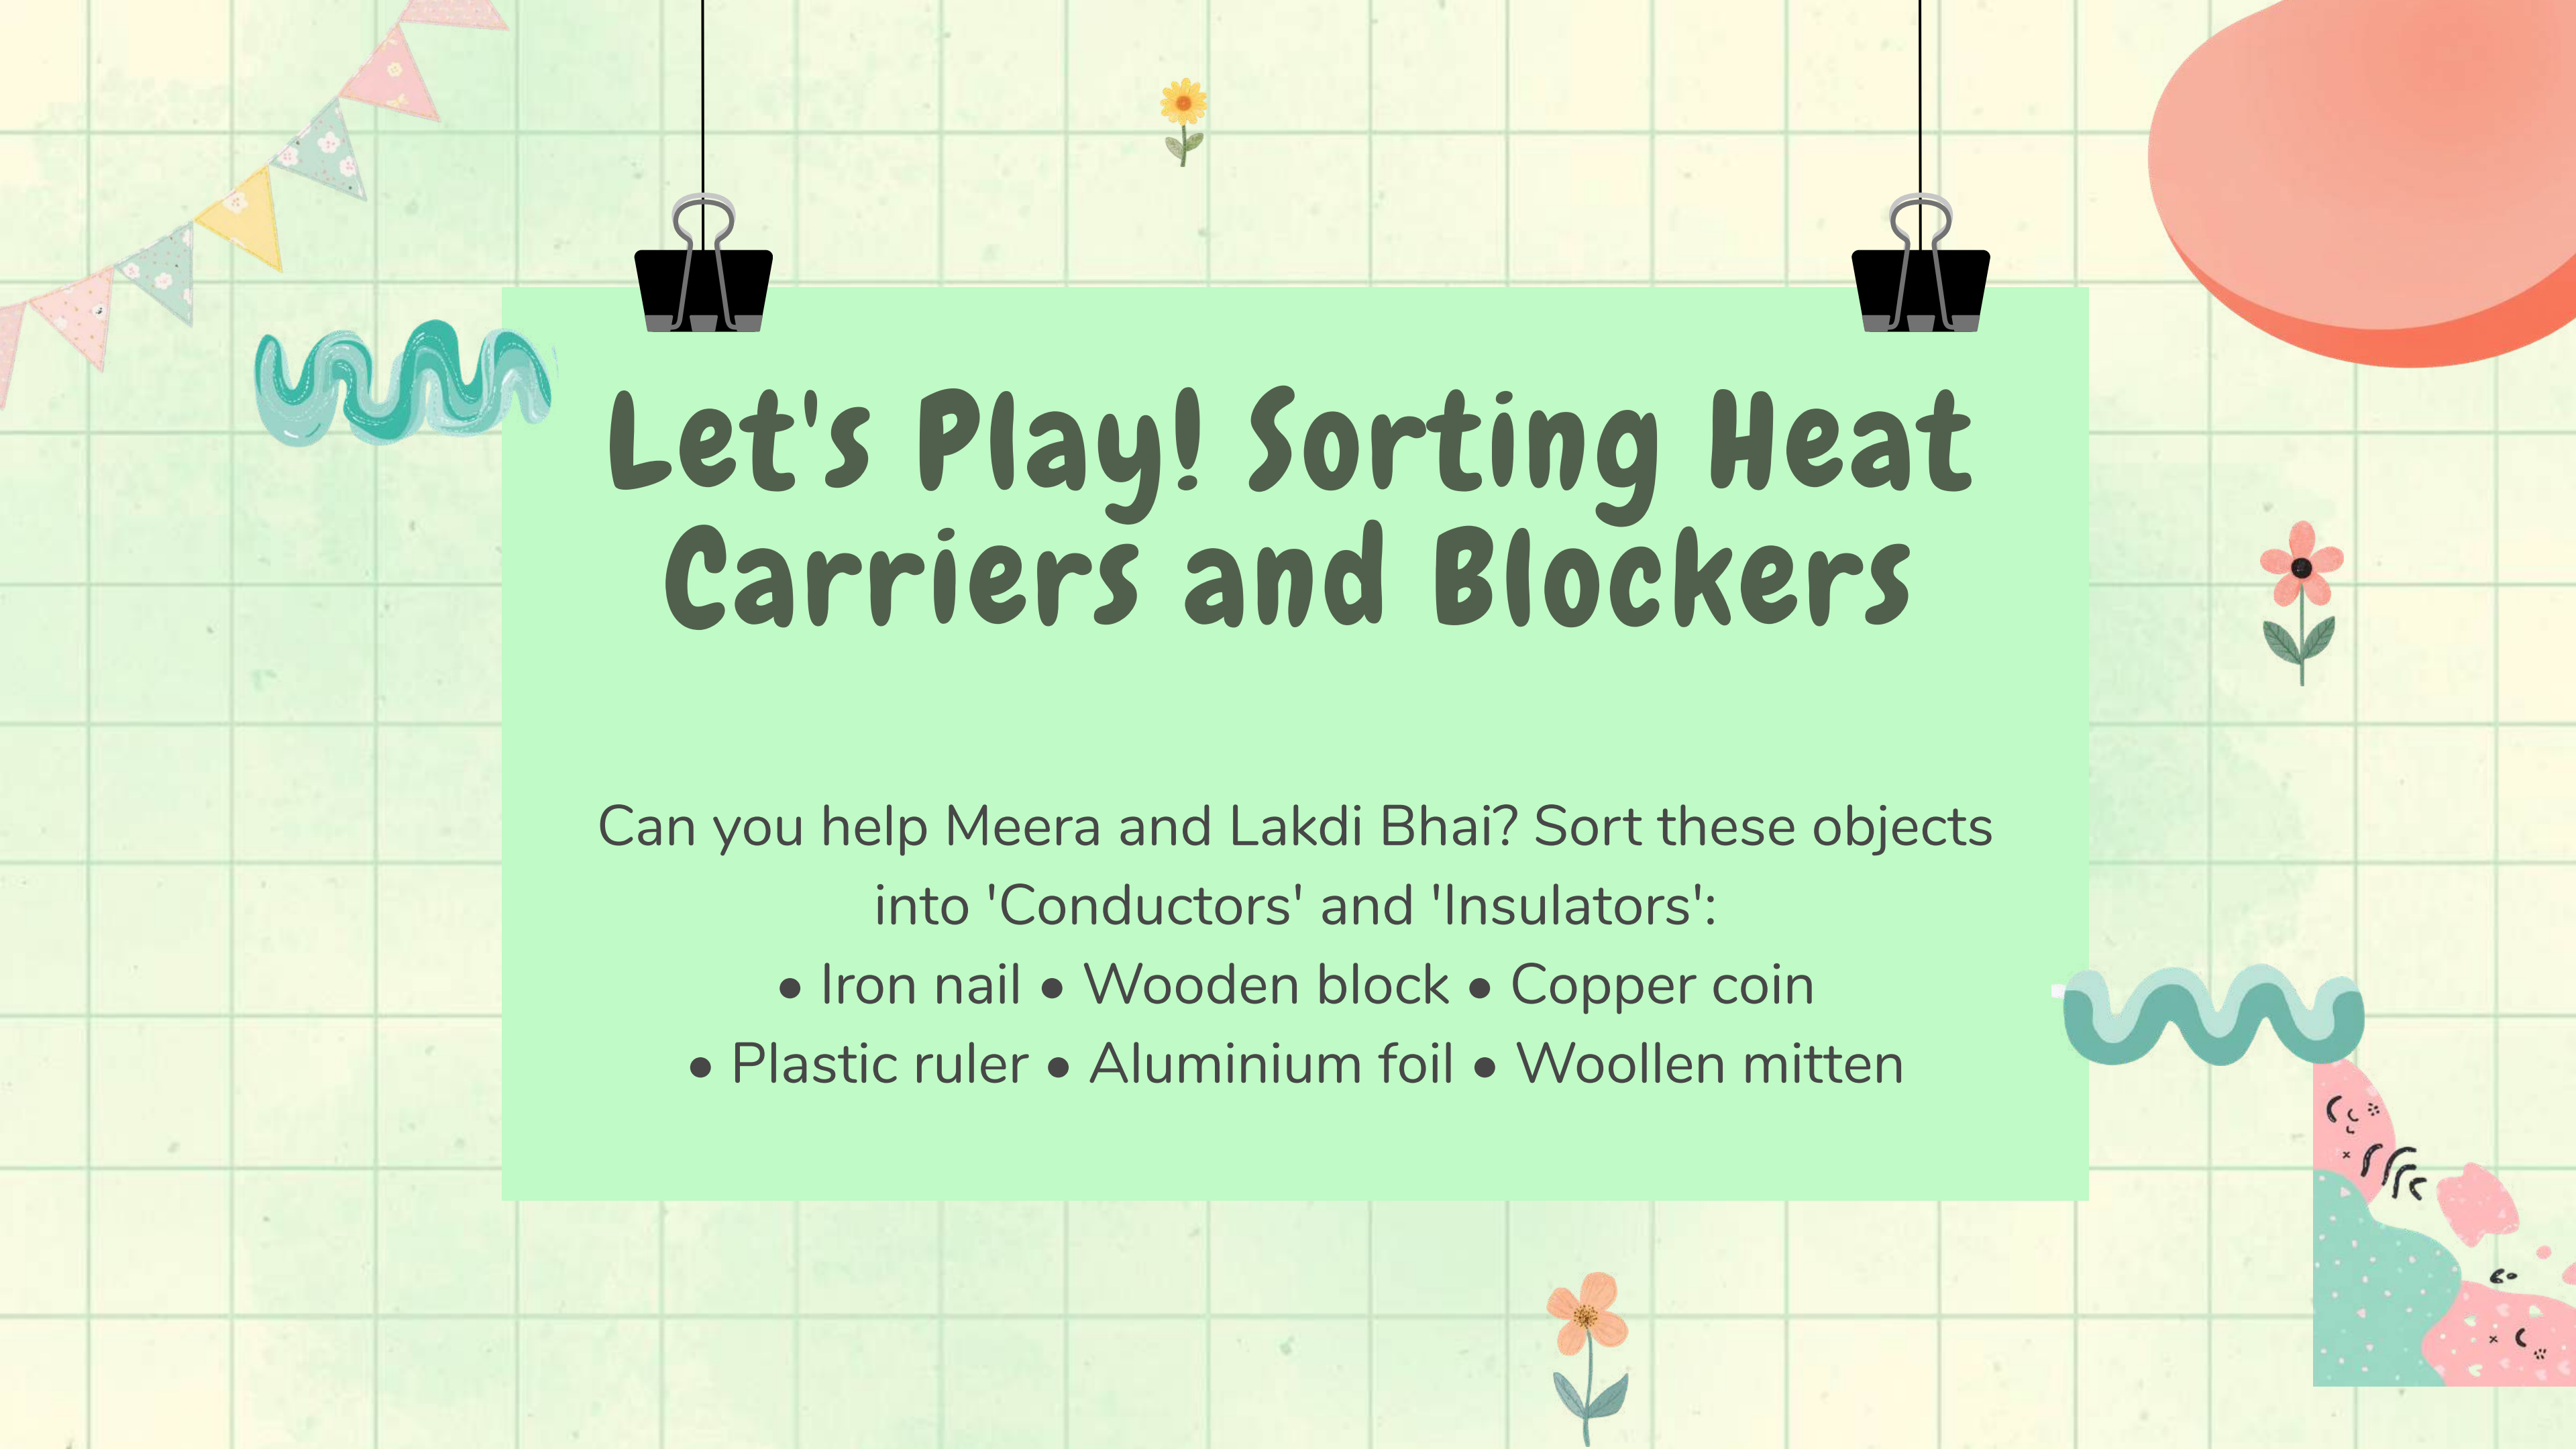

Safety First in the Kitchen!

Always hold wooden or plastic handles when
the vessel is hot.

Never touch hot metal spoons with bare hands.
Use cloth or pot holders to be safe.

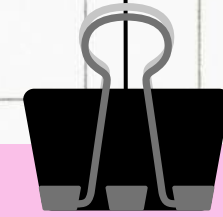

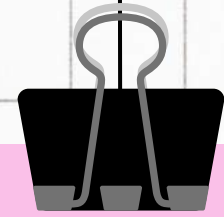

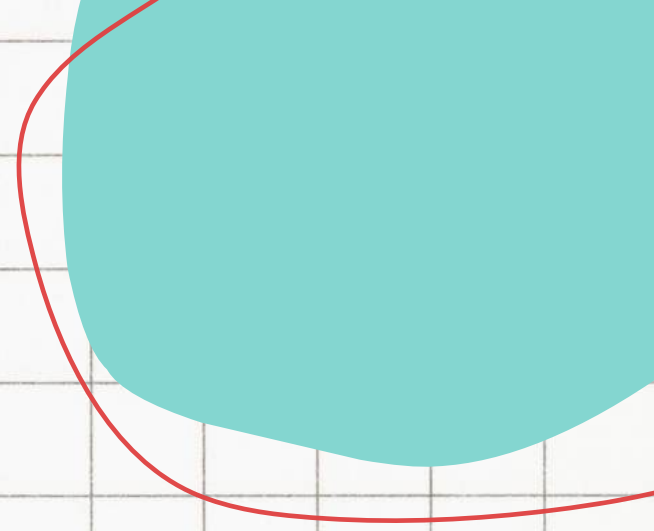

Let's Play! Sorting Heat Carriers and Blockers

Can you help Meera and Lakdi Bhai? Sort these objects into 'Conductors' and 'Insulators':

- Iron nail • Wooden block • Copper coin
- Plastic ruler • Aluminium foil • Woollen mitten

Mini Quiz: Test Your Knowledge!

Question 1: What is heat?

a) Energy that makes things warm b) Water c) Air

Question 2: Which material carries heat fast?

a) Metal b) Wood c) Cloth

Question 3: What should you use to hold a hot vessel?

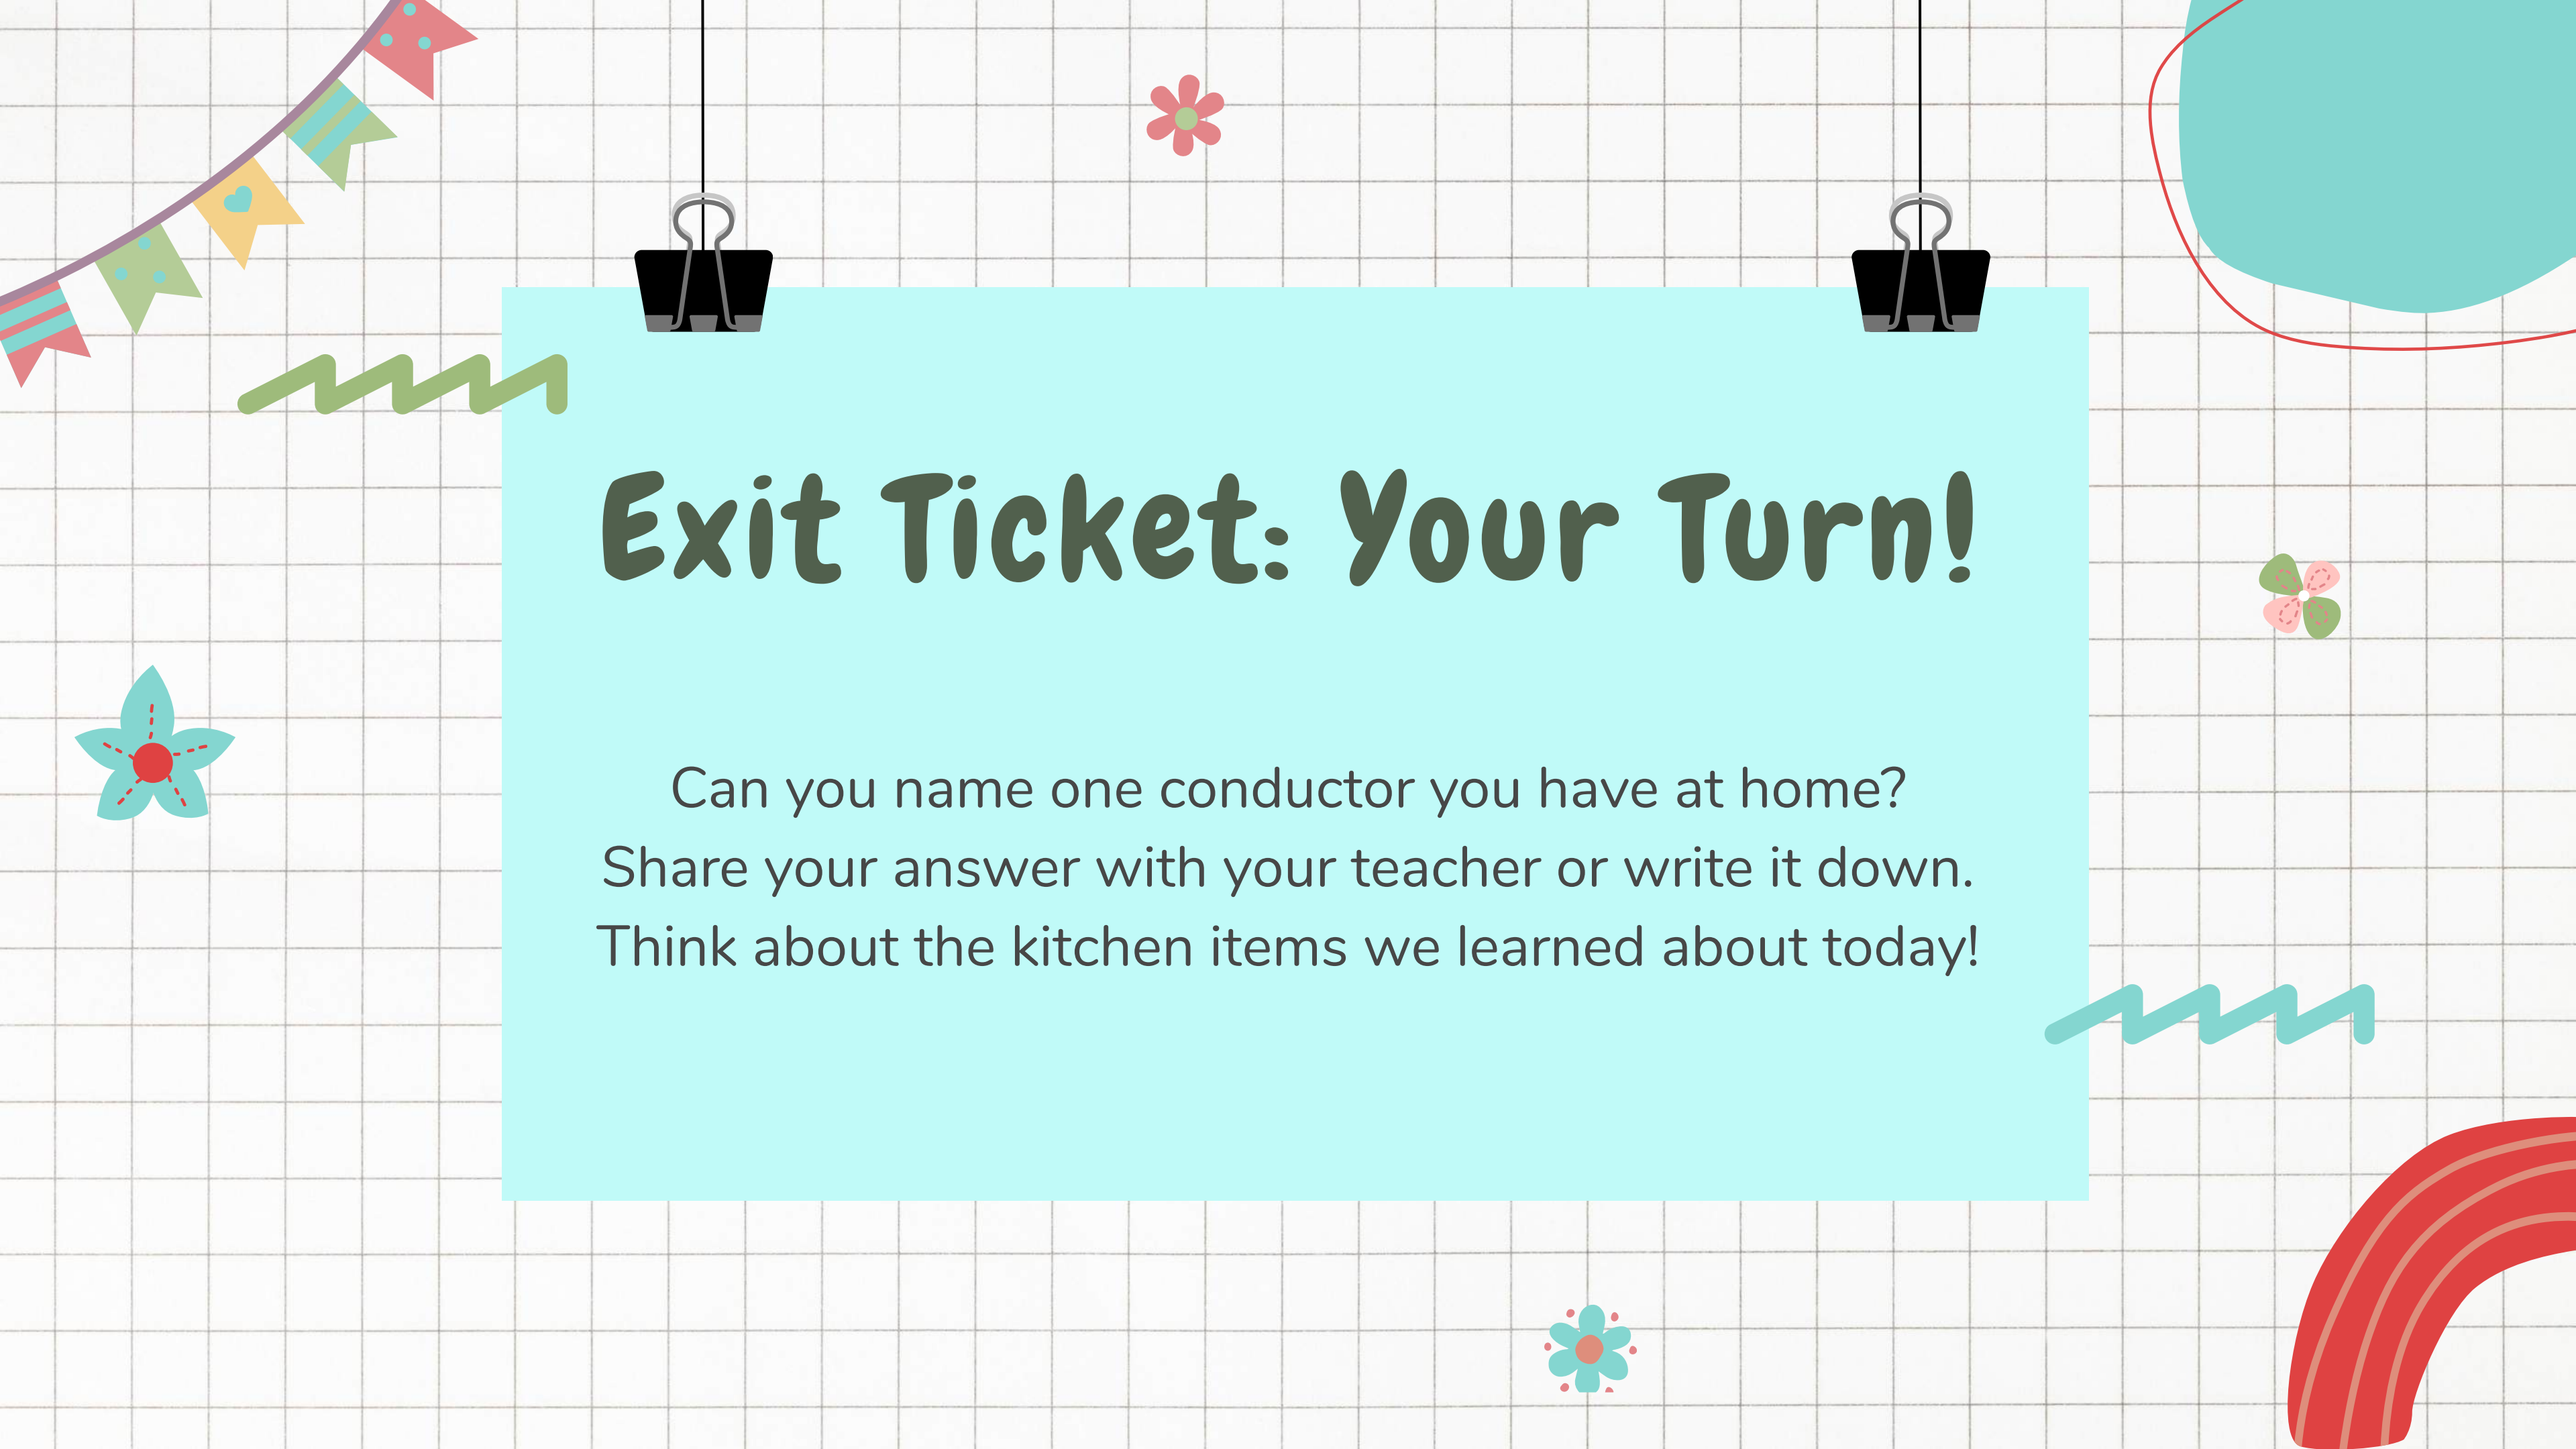

a) Wooden handle b) Metal spoon c) Bare hand

Let's Remember What We Learned

- ☀ Heat is energy that makes things warm
- 🤝 Heat moves by touching — called conduction
- ⚡ Metals carry heat fast (conductors)
- 🪵 Wood and plastic carry heat slowly (insulators)
- 🛡 Always be careful and use safe handles

Exit Ticket: Your Turn!

Can you name one conductor you have at home?
Share your answer with your teacher or write it down.
Think about the kitchen items we learned about today!

Thank You!
