

HTML –

Buttons That Do Things!

```
<button>Click Me!</button>
```

45–60 min

HTML

Any Browser

India Context

Today you will build your FIRST web button! 🚀

What You'll Learn Today

1

Understand that buttons exist everywhere — in real life AND on websites

2

Learn what HTML is and why it is called a 'recipe card' for web pages

3

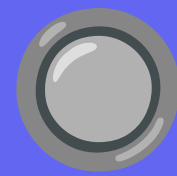

Understand what an HTML tag is and how opening/closing tags work

4

Write a working `<button>` tag in HTML — all by yourself!

5

Complete three levels of challenges: Easy → Medium → Bonus! 🏆

Buttons Are Everywhere!

Ask the class: What happens when you press these buttons? 🤔

▶ PLAY

YouTube

→ Starts the video

🛒 ORDER NOW

Zomato / Swiggy

→ Sends your order

💰 PAY

Google Pay

→ Transfers money

📢 VOL ▲ ▼

TV Remote

→ Changes volume

▲ ▲ UP

Elevator

→ Calls the lift

1 2 3 4 1 2 3...

ATM Keypad

→ Enters numbers

Meet HTML — The Recipe Card!

HTML = HyperText Markup Language — the language that tells a web browser **what to display and how to arrange everything**.

Recipe Card

Ingredients: Dal, chawal, salt

Step 1: Boil the water

Step 2: Add dal & simmer

Step 3: Serve hot!

HTML Page

Content: Heading, image, button

Show: A big title at the top

Then: Add a paragraph below

Finally: Place a button!

Just like a recipe card gives cooking instructions, HTML gives display instructions to your browser! 🔍

What Is an HTML Tag?

Tags are like labels on a lunchbox 🍱 — they tell you what's inside! Tags use angle brackets: `< >`

Opening Tag

```
<button>
```

Tells the browser
'start this thing here!'

Content

```
Click Me!
```

What appears inside
between the tags

Closing Tag

```
</button>
```

Tells the browser
'done! end here!'

The TAG SANDWICH Rule:

Top bread = `<button>` | Filling = your text | Bottom bread = `</button>`

Without BOTH slices of bread, it's not a sandwich — and without BOTH tags, it's not valid HTML! ❌

★ The Golden Rule of Tags

Every opening tag needs a matching closing tag!

Opening tag	→	<code><button></code>
Content	→	<code>Click Me!</code>
Closing tag	→	<code></button></code>

The `/` in `</button>` means: 'We are DONE with this button!'

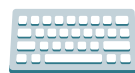

Think of opening/closing tags as a pair of brackets — one opens, one closes! 

Build Your First Button!

```
<button>Click Me!</button>
```

1

TYPE

Type the code exactly:
<button>Click Me!</button>

2

RUN

Press the Run or Preview
button in your editor

3

SEE

Look at the result panel — your
button appears!

4

CLICK!

Click your button — what
happens? Try it!

Clicking a plain button doesn't do much yet — next lesson we'll add actions with JavaScript!

Student Challenges — 3 Levels!

EASY ★

📌 Change the button text to say "Hello India!" instead of "Click Me!"

💡 Only change what is between the tags — keep `<button>` and `</button>` exactly the same.

✅ I changed the text between the tags ✓

```
<button>Hello India!</button>
```

MEDIUM ★★

📌 Make TWO buttons appear on your page, one below the other.

💡 Just write the button tag twice! Each line creates one button.

✅ I wrote the button tag twice ✓

```
<button>Button One</button>
<button>Button Two</button>
```

BONUS ★★★

📌 Make a button that says your favourite food! (Dosa, Pizza, Idli...)

💡 Replace the text with whatever food you love most. Be creative!

✅ I put my favourite food on a button ✓

```
<button>I Love Dosa! 🍛</button>
```

Key Concepts — Let's Recap!

1

HTML is like a Recipe Card

It gives instructions to the browser about what to display on a web page.

2

Tags are like Labels

They wrap around content to tell the browser what type of thing it is.

3

The `<button>` tag creates buttons

Whatever text you put between `<button>` and `</button>` becomes the button's label.

4

The `/` means 'Done!'

The closing tag tells the browser 'we've finished describing this button'.

5

Buttons need BOTH tags

Opening tag + content + closing tag = complete HTML element. Never forget to close!

Quick Reference Card + What's Next?

HTML Tag	What It Does	Example Code
<code><button></code>	Creates a clickable button	<pre><button>Click Me!</button></pre>
<code><h1></code>	Creates a big heading	<pre><h1>Hello World!</h1></pre>
<code><p></code>	Creates a paragraph of text	<pre><p>I love coding!</p></pre>
<code>
</code>	Adds a line break	<pre>Line one
Line two</pre>

NEXT TIME... We'll Make Buttons COLOURFUL!

CSS Colors — add background & text color

Hover Effects — change on mouse over

CSS Sizing — make buttons bigger with padding

onclick Action — make buttons DO things with JavaScript!
