The Broken Scoreboard!

Meet Aarav! He is playing a fun quiz game on his computer.

Aarav reads a question and clicks the **correct answer**. Yay!

But wait... look at the scoreboard. It still says **0**!

Oh no! Why is the scoreboard frozen?

The computer does not know how to add points by itself. It needs our help!

To fix it, we need to write a special tool called a **JavaScript Function**. This function will watch the game, count the points, and update the screen instantly!

Concept A: What is a Variable?

Imagine you go to a small corner store (a Kirana store). The shopkeeper uses a little **chalk slate** to draw lines and tally items sold during the day.

In computer coding, a **Variable** is just like that chalk slate! It is a magic box that holds information that can change, like your game score.

First, we start our score at zero:

```
let score = 0;
```

When you win a point, we update the slate by writing:

```
score = score + 1;
```

This tells the computer: "Take the old score, add 1 to it, and write the new number on the slate!"

Concept B: Shall We Lock It?

On the famous KBC TV show, the host always asks: *"Shall we lock option A?"*

The computer does the exact same thing! It checks your choice using an **If Statement**. It asks: "Is this answer right?"

```
if (playerAnswer == "A") {  
    score = score + 1;  
}
```

How it works:

If your answer matches the right one, the computer opens the curly brackets { } and adds 1 point to your score. If you are wrong, it skips it!

Concept C: The Railway Board

Have you ever been to a big train station? There is a huge board on the wall that shows when trains are coming and going. The letters and numbers change live right before your eyes!

In JavaScript, we change the text on a webpage live using a tool called **.innerText**.

We tell the computer to find our scoreboard and put our new score inside it:

```
document.getElementById("score-card").innerText = score;
```

The very millisecond you click the button, the magic railway board updates on your screen!

How It All Flows Together

Let us look at the 3 magical steps that happen every time you play:

- 1 Click a Button:** You pick an answer. The computer runs code to update the score variable: `score = score + 1`.
- 2 The Big Check:** An `if / else` block tests if your choice is correct or wrong.
- 3 Show the Screen:** `innerText` instantly pushes the new score onto the screen so you can see it!

Code-Along Part 1: Score & Check

Here is the complete JavaScript script to make your quiz work perfectly. Read it like a storybook!

```
let score = 0;

function checkAnswer(playerChoice) {
  if (playerChoice == "Tiger") {
    score = score + 1;
    document.getElementById("msg").innerText = "Correct! Clear answer!";
  } else {
    document.getElementById("msg").innerText = "Oops! Try again!";
  }
  document.getElementById("score-display").innerText = score;
}
```

See? If they choose "Tiger", they get a point and a happy message! Otherwise, they get an "Oops!" message.

Code-Along Part 2: Wiring Buttons

Now, let's connect our code to real buttons that you can click on your screen!

When a player clicks **Button B**, it calls our special function:
`checkAnswer("Tiger")`.

The scoreboard wakes up, adds 1, and changes live right before your eyes!

Bug Hunting: The Frozen Counter

Uh oh! Sometimes coders make mistakes called **Bugs** 🐛. Let's practice finding one!

❌ Bug Code (Frozen!)	✅ Correct Code (Increments!)
<code>score = 1;</code>	<code>score = score + 1;</code>
Every single time you click, the score is set exactly to 1. It will never go up to 2 or 3!	This adds 1 to whatever number was already there. So 1 becomes 2, then 3, then 4!

Personalize & Celebrate!

Good coders make games fun! You can change the win messages to say anything you like. Here are some fun ideas:

- ✨ "Shabaash! Correct answer!"
- 💥 "Dhamaka! +1 Point!"
- 🎉 "Superb! You scored again!"
- 🏆 "Wah! Perfect score!"

 **You Made It!**

Congratulations! You have earned your **Junior Quiz Developer Badge!**

Keep coding, keep building, and keep changing the world! 🚀
