

SINK OR FLOAT? LET'S FIND OUT!

Density Intro

INTRODUCTION

What happens when we put things in water?
Some things go down to the bottom, and some
things stay up at the top!
Today we will discover why this happens and have
lots of fun exploring together!

What is Sinking?

“When something is heavy for its size, it goes down to the bottom of the water. We call this sinking! The scientific word for being heavy for your size is dense. Dense objects are packed with lots of matter in a small space, so they are heavier than the same amount of water and down they go!”

Heavy for size? Down it goes!

What Does Floating Mean?

“When something floats, it stays on top of the water. Objects that are light for their size are less dense than water. Because they weigh less than the same amount of water, water pushes them up and they rest on the surface.”

Things That Sink

Some objects are heavy for their size!
Rocks, coins, keys, and marbles all sink to
the bottom of the water.

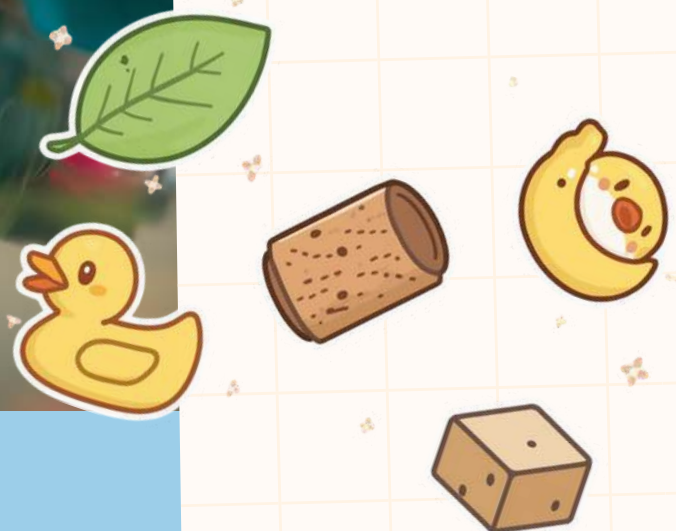

They're too dense to float!

Things That Float!

Some things are light for their size! Leaves, corks, plastic toys, and wooden blocks all float on water because they are less dense.

Light for size = floats!

Let's Try It!

Get a bowl of water and collect different objects from around you. Before putting each object in water, guess - will it sink or float? Then test it and see if you were right!

Guess first, then test!

BIG WORD ALERT: DENSITY!

It means how much stuff is
packed inside something!

GREAT JOB SCIENTISTS!

Keep exploring what sinks and floats at home!
