

PYTHON —
BUILD YOUR FIRST
REST API
WITH FLASK!

WHAT IS AN API?

MEET WAITER FLASK-y!

1. Imagine ordering your favourite snack at Dhaba.
2. The waiter (API) takes your order to the kitchen (Server).
3. The waiter brings your food back to you!

CLIENT, SERVER & JSON!

1. Client = YOU — the customer placing the order.
2. Server = The Kitchen — where your data is prepared!
3. JSON = The secret menu card both computers understand.

Quiz: What does JSON look like?

A) A secret menu card B) A cooking pot C) A restaurant table

LET'S CODE!

```
from flask import Flask,  
jsonify  
app = Flask(__name__)
```

`@APP.ROUTE('/MENU')`

```
def get_menu():  
    indian_menu = {  
        "snack": "Samosa",  
        "drink": "Masala Chai",  
        "sweet": "Gulab Jamun"  
    }  
    return jsonify(indian_menu)
```

TEST YOUR API!

```
if __name__ == '__main__':  
    app.run(port=5000)
```

Open `http://localhost:5000/menu` in your browser

RECAP & YOUR CHALLENGE!

1. API = a waiter delivering data between client & server.
 2. Client asks, server responds with JSON — the secret language!
 3. Flask builds routes like '/menu' that return tasty JSON data.
- Challenge: Build '/my-team' route! Return: team_name, captain, trophies_won, top_batsman 🏏

GREAT JOB TODAY!
