

REACT: INTRO TO COMPONENTS

**DID YOU KNOW SWIGGY
& YOUTUBE ARE BUILT
LIKE LEGO BRICKS?
APPS ARE MADE OF
SMALL PARTS CALLED
COMPONENTS!**

WHAT IS REACT?

- React is a special JavaScript library made by Facebook! It helps us build webpages using small, reusable parts. Think of it like building with Lego bricks – you can use the same pieces again and again to create amazing things!
- Lego bricks are React's building blocks – snap them together to build cool apps!

WHAT IS A COMPONENT?

- Think of a tiffin dabba! Each compartment holds different food — dal, rice, Vegetable, roti. Each part is small, but together they make a complete meal. React components work the same way!
- Components are small pieces of a webpage that work together!

COMPONENTS ARE LIKE TRAIN COMPARTMENTS

- Just like an Indian train has many compartments, each with its own job — some for sitting, some for sleeping, some for luggage — React components each do their own special task!
- But together, they work as a team to carry all the passengers safely to their destination.
- Components work together, just like train coaches!

ANATOMY OF A REACT COMPONENT

FUNCTION DECLARATION

Names start with a capital letter — like your name in the class register!

JSX

Looks like HTML but lives inside JavaScript code!

RETURN STATEMENT

Gives back what to show on screen — like a sweet -wala handing you sweets!

CODE EXAMPLE: GREETING COMPONENT

```
function Greeting() {  
  return Namaste! Welcome to React!  
}
```

Function name starts with capital letter,
return gives back what to show, and JSX
looks like HTML!

THIS COMPONENT SAYS HELLO!

The function name "Greeting" tells us what it does. The return statement gives back our message. The JSX inside looks like HTML magic!

REUSING COMPONENTS IS LIKE A RUBBER STAMP

- In React, you write a component once and use it many times! It's just like a rubber stamp — you create the design once, then stamp it again and again wherever you need it.
- Components save time and effort!

MEET THE APP COMPONENT: THE MITHAI BOX

- The App component is like a beautiful sweet box! Just like how a sweet box holds many delicious sweets in different sections, the App component holds all your smaller components inside it.
- App component is the big box that keeps everything organized!

CODE EXAMPLE: APP USING GREETING COMPONENTS

```
function App() {  
  return (  
  );  
}
```

HOW IT WORKS

The App component is like a big mithai box! It holds two Greeting components inside. Each shows "Namaste!" on the screen.

GUIDED PRACTICE: FILL IN THE BLANKS

COMPLETE THE CODE!

```
function _____() {  
  return Namaste!;  
}
```

THINK ABOUT IT!

Can you name the function? What does it return?
Fill in the blank to complete your first component!

MINI-CHALLENGE: BUILD YOUR NAMASTE CARD

CREATE YOUR NAMECARD COMPONENT

Write a NameCard component that displays your name. Use function NameCard() and return your name inside an `h1` tag!

COMBINE COMPONENTS IN APP

Put both Greeting and NameCard components inside your App component. Show your React skills!

LET'S RECAP WHAT WE LEARNED

Great job learning about React components today! Here are the key points to remember from our coding adventure.

**EXIT TICKET:
WHAT IS A
COMPONENT?**

BONUS SLIDE: FUN REACT FACTS!

REACT WAS BORN IN 2013!

React was created by Facebook engineers. It started as a small project and grew into one of the most popular tools for building websites!

BIG WEBSITES USE REACT!

Instagram, Netflix, and many other apps you love are built with React. Even WhatsApp Web uses it!

WHAT DOES "REACT" MEAN?

React means "to respond quickly!" That's exactly what React does – it makes websites respond fast to your clicks and taps!

**THANK YOU & KEEP
EXPLORING REACT!**

Great job learning about components! Keep coding
