

JavaScript — Make a Webpage Interactive!

The Boring Festival Page

Ishaan visits an Independence Day website...

He sees a gray box and clicks a button.

Nothing happens! The page is boring and lifeless.

JavaScript is the missing magic wire
that makes webpages come alive!

Meet the Webpage Family

- HTML = Bamboo sticks & wooden frames
- (Structure of the Pandal)
- CSS = Colorful silk cloths, marigold
- garlands & shiny lights (Decoration)
- JavaScript = Electrical switchboard
- that makes lights dance! (Behavior)

What is a JavaScript Event?

Think of an auto-rickshaw driver...

Event Listener = Driver's listening ear

Button Click = You shout 'Bhaiya, Auto!'

Driver reacts instantly!

An EVENT is something that happens
(like a click) that triggers an action!

How JavaScript Finds Things

Like a teacher calling roll numbers...

Teacher calls ONE roll number
Only THAT student stands up!

JavaScript uses a unique ID to find
exactly which element to change.

Changing Colors — Holi Gulal!

- Changing background color is like splashing vibrant Holi colors!
- JavaScript makes webpage colors change instantly with one line:
- `document.body.style.backgroundColor = 'orange';`

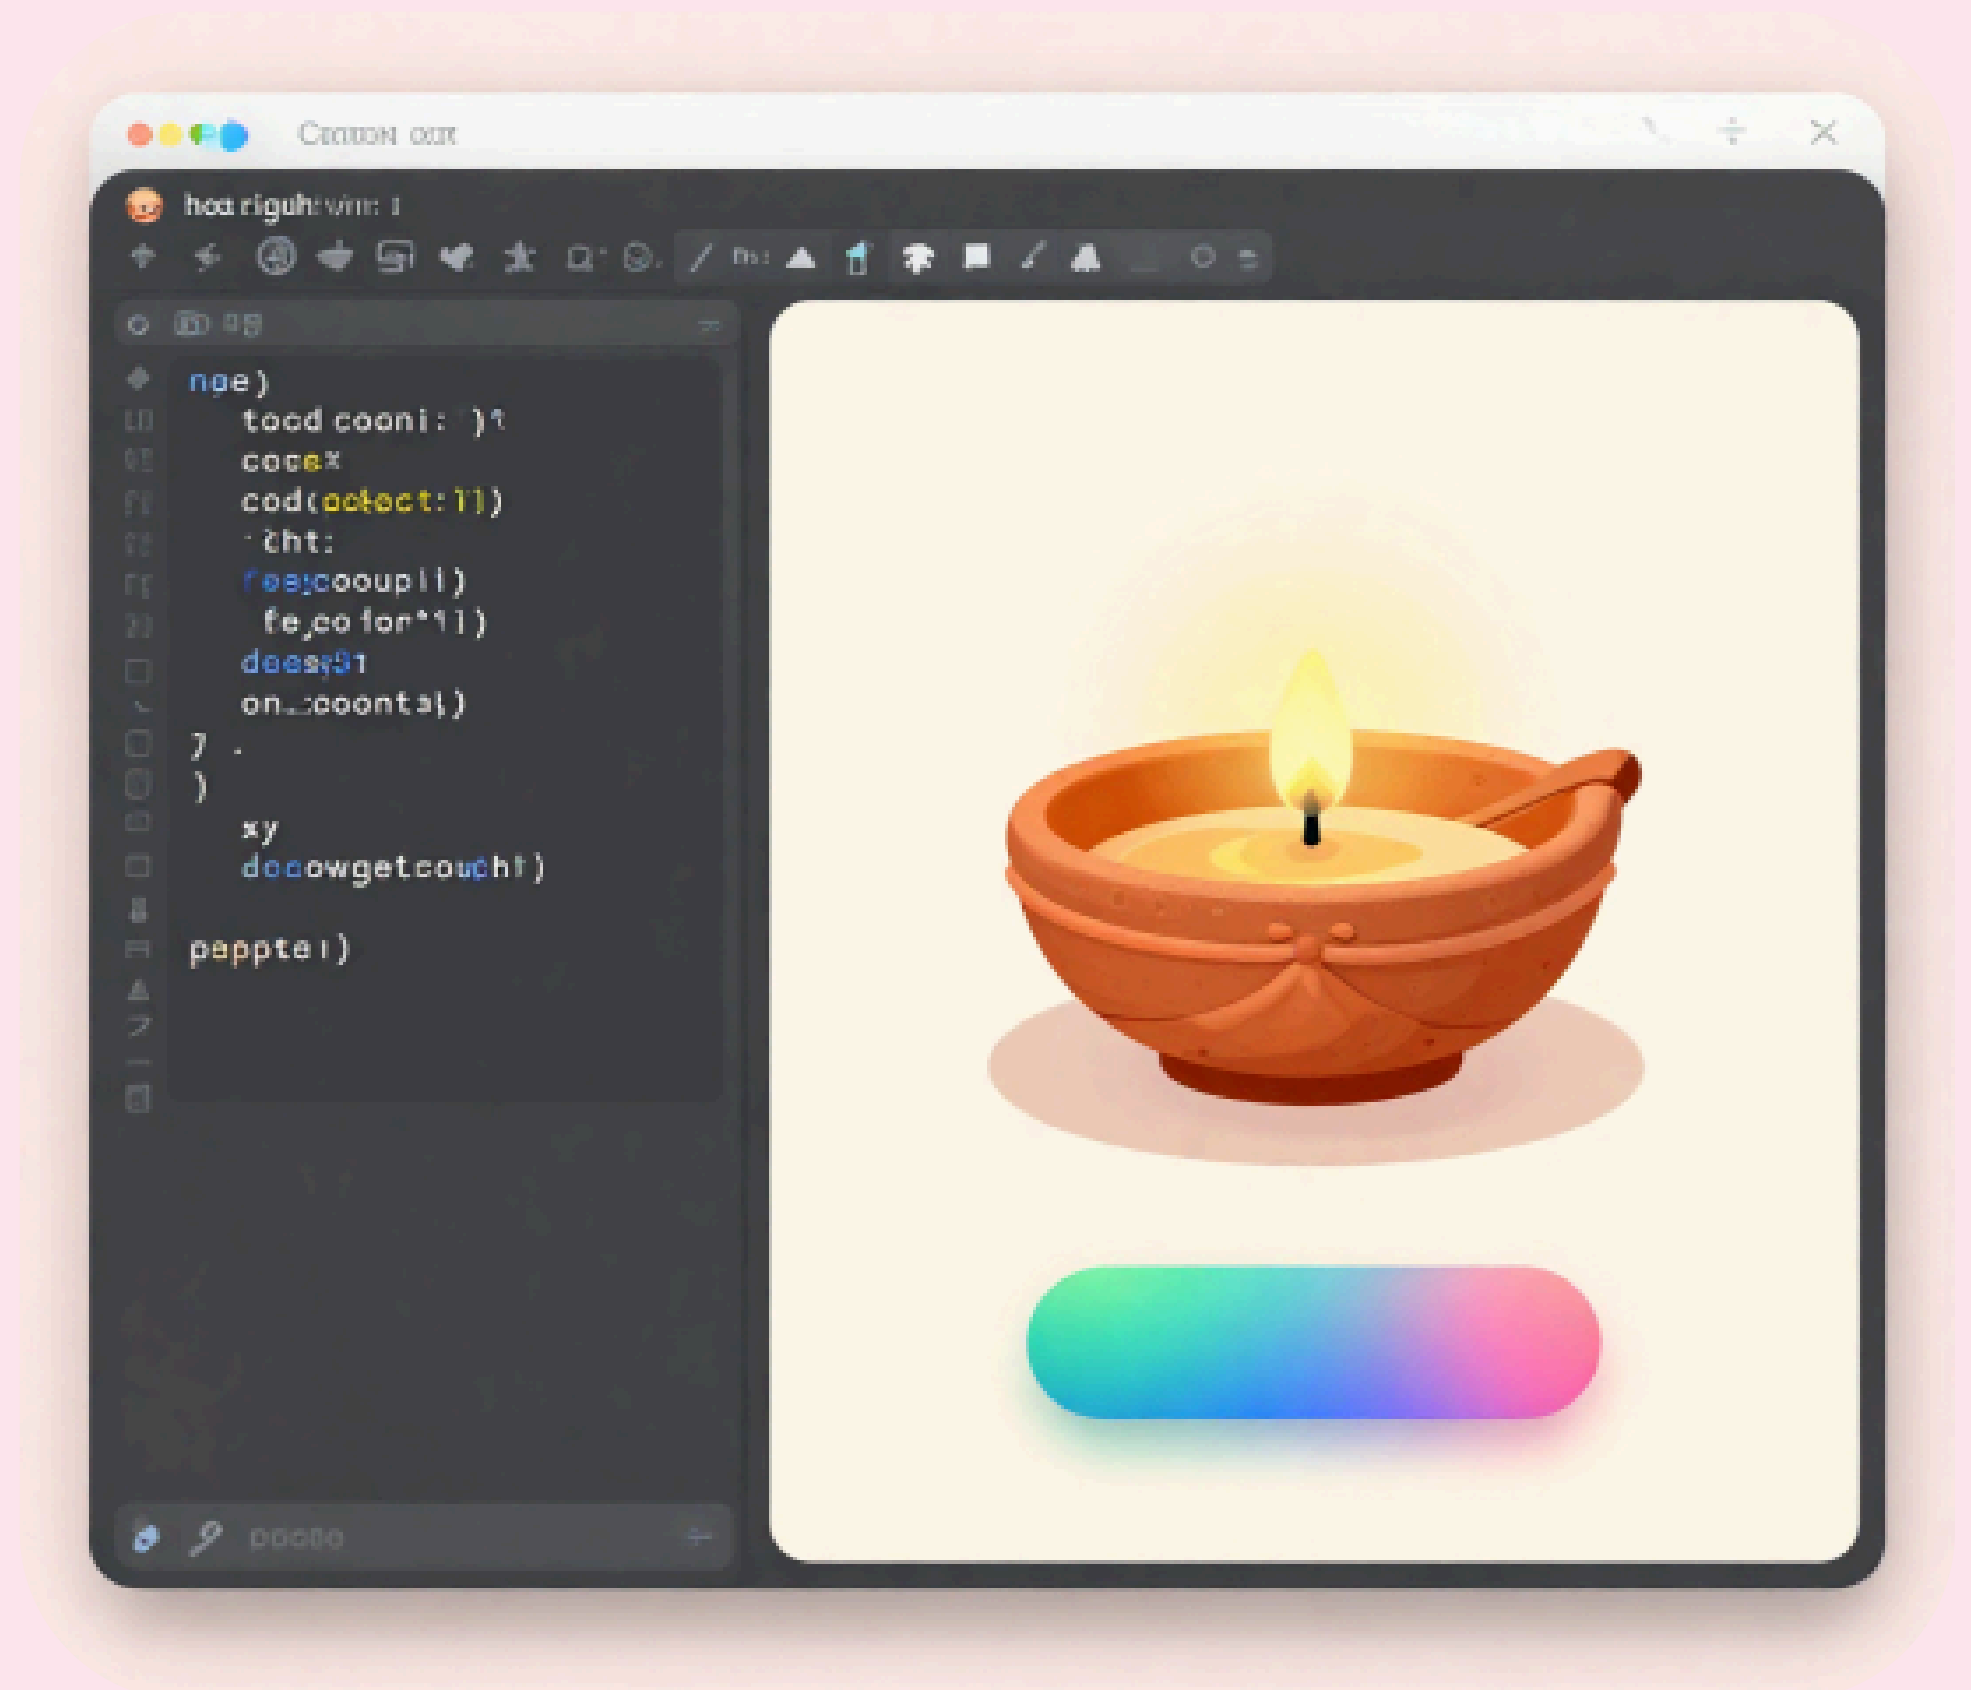

The Magic Diya Switch — Part 1

We write a function:

```
function lightDiya() {  
  document.getElementById('diya')  
    .src = 'glowing-diya.png';  
}
```

Then connect it to a button:

```
<button onclick='lightDiya()'  
  Light the Diya!  
</button>
```

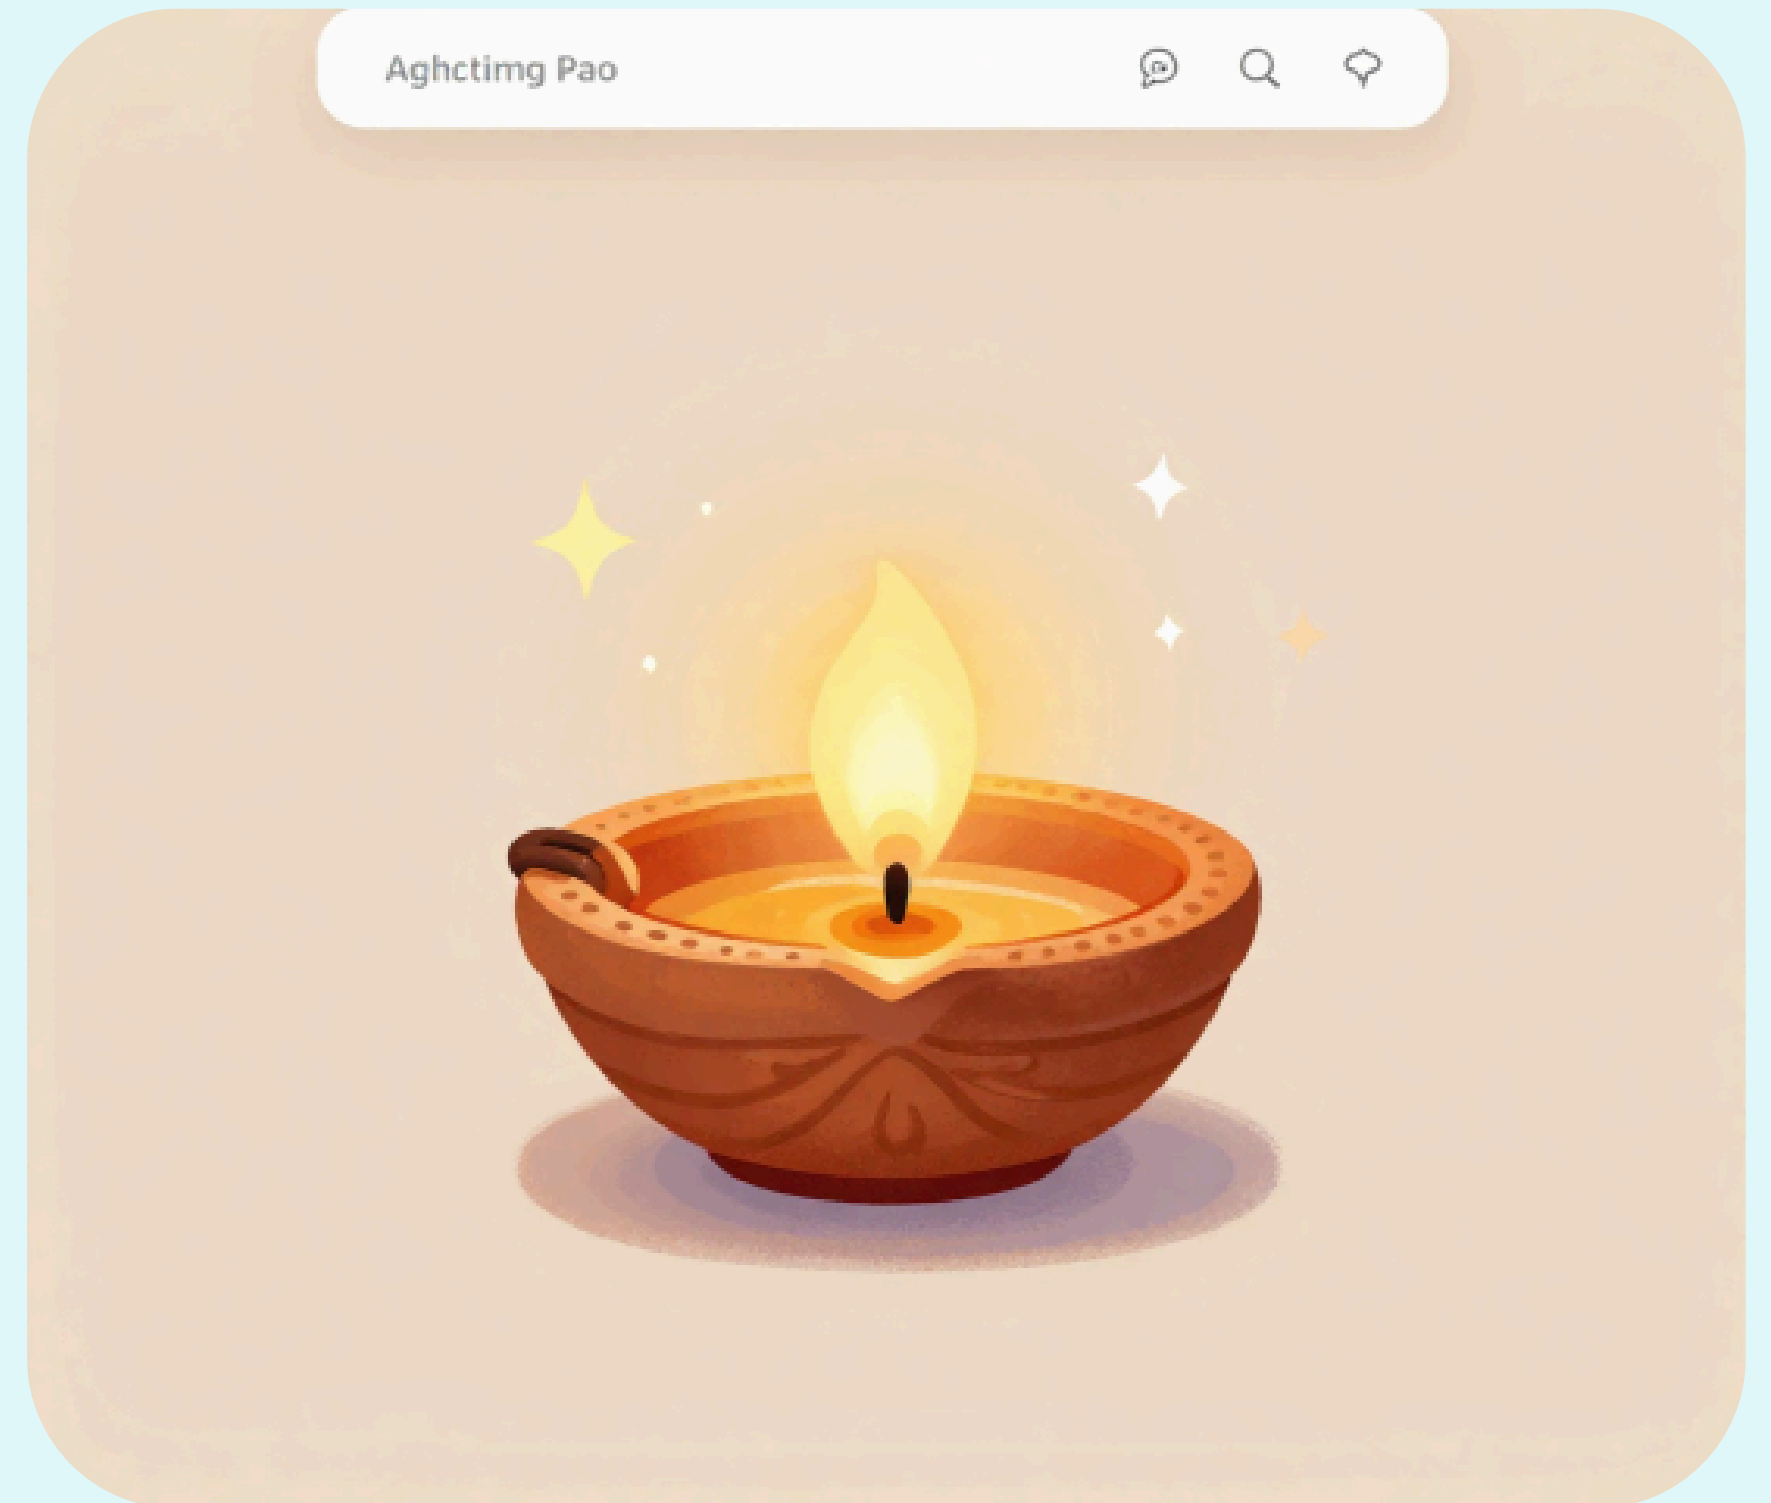

The Magic Diya Switch — Part 2

Press the button...

The diya GLOWS!

JavaScript changed the image
from unlit to a beautiful
glowing flame.

That is JavaScript magic in action!

The Bug Hunt — Fix the Broken Wire!

JavaScript says: `getElementById('deeya')`
But HTML says: `id='diya'`

Spelling mismatch = Bug!
The button click fails.

Can you spot the mistake
and fix it?
