

Coordinate Geometry: Let's Plot Points!

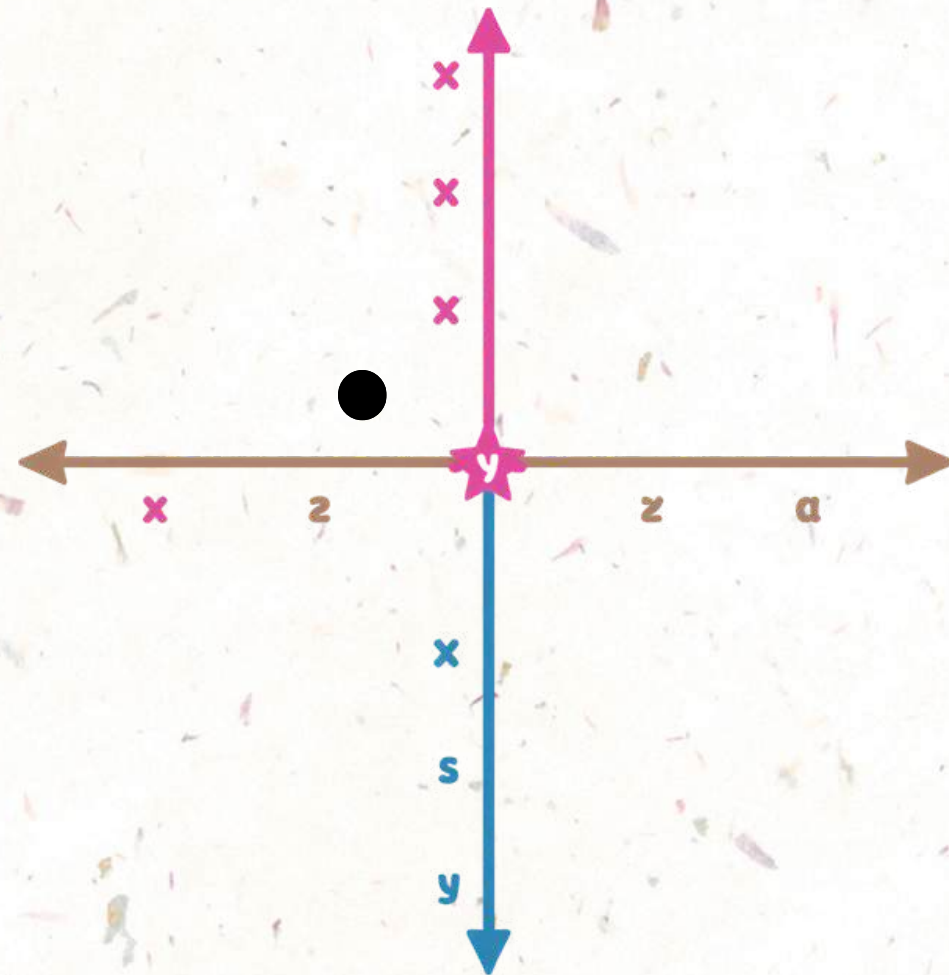

What is a Coordinate Grid?

A coordinate grid is like a special map that helps us find exact spots using numbers! It has lines going across (left and right) and lines going up and down. Where the lines meet, we can mark a point. It's like playing a treasure hunt game where numbers tell us exactly where to look!

Meet the X and Y Axes!

X & Y

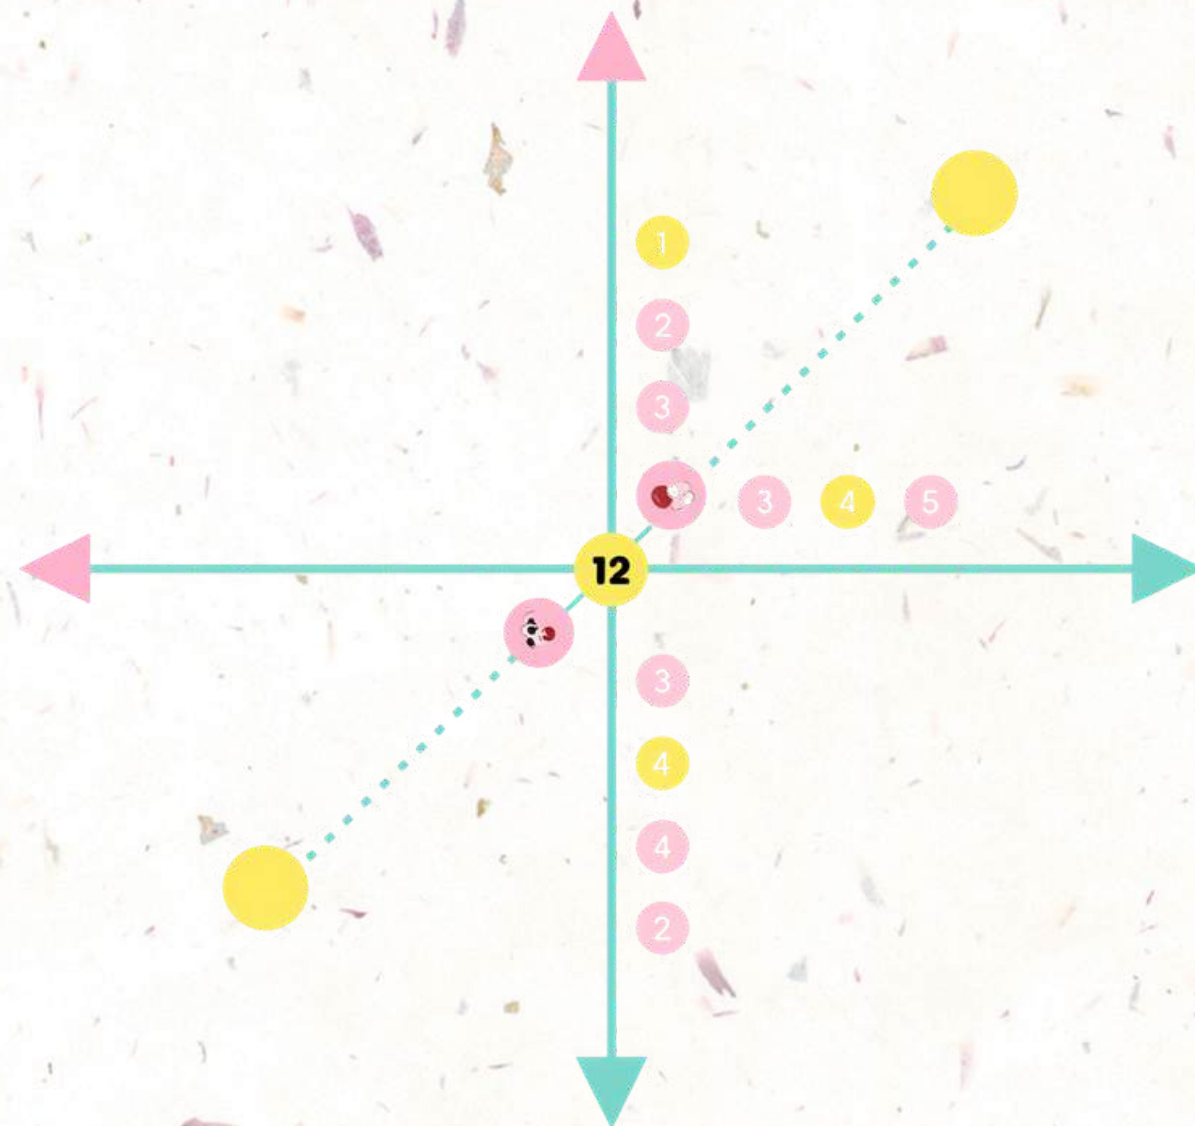

Understanding the Axes:

The horizontal line going left and right is called the X-axis. The vertical line going up and down is called the Y-axis. They meet at a special point called the origin!

Reading Coordinates

To read a point on the grid, start at zero. Count how many steps you walk to the right (X), then count how many steps you climb up (Y)!

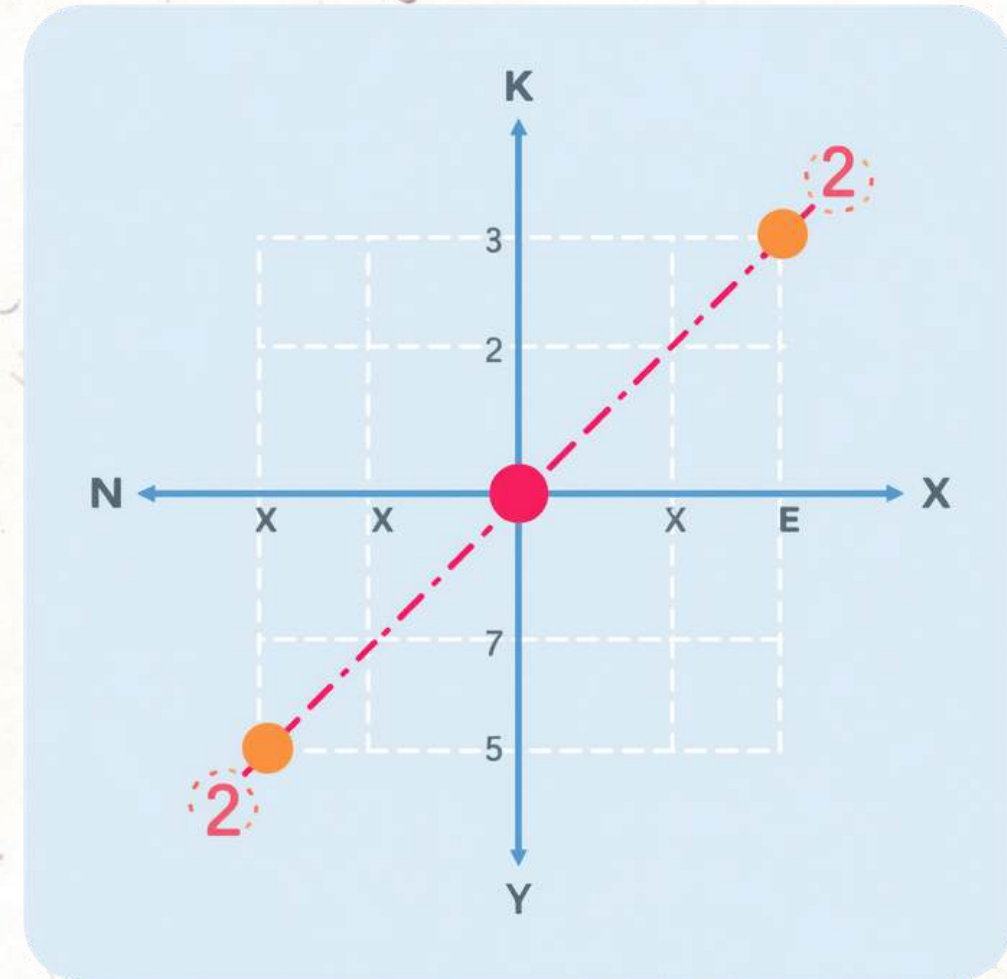

Remember:
First go across (X), then go up (Y) - like walking then climbing a ladder!

Let's Plot Together!

Follow the steps to plot
point (3, 2) on the grid!

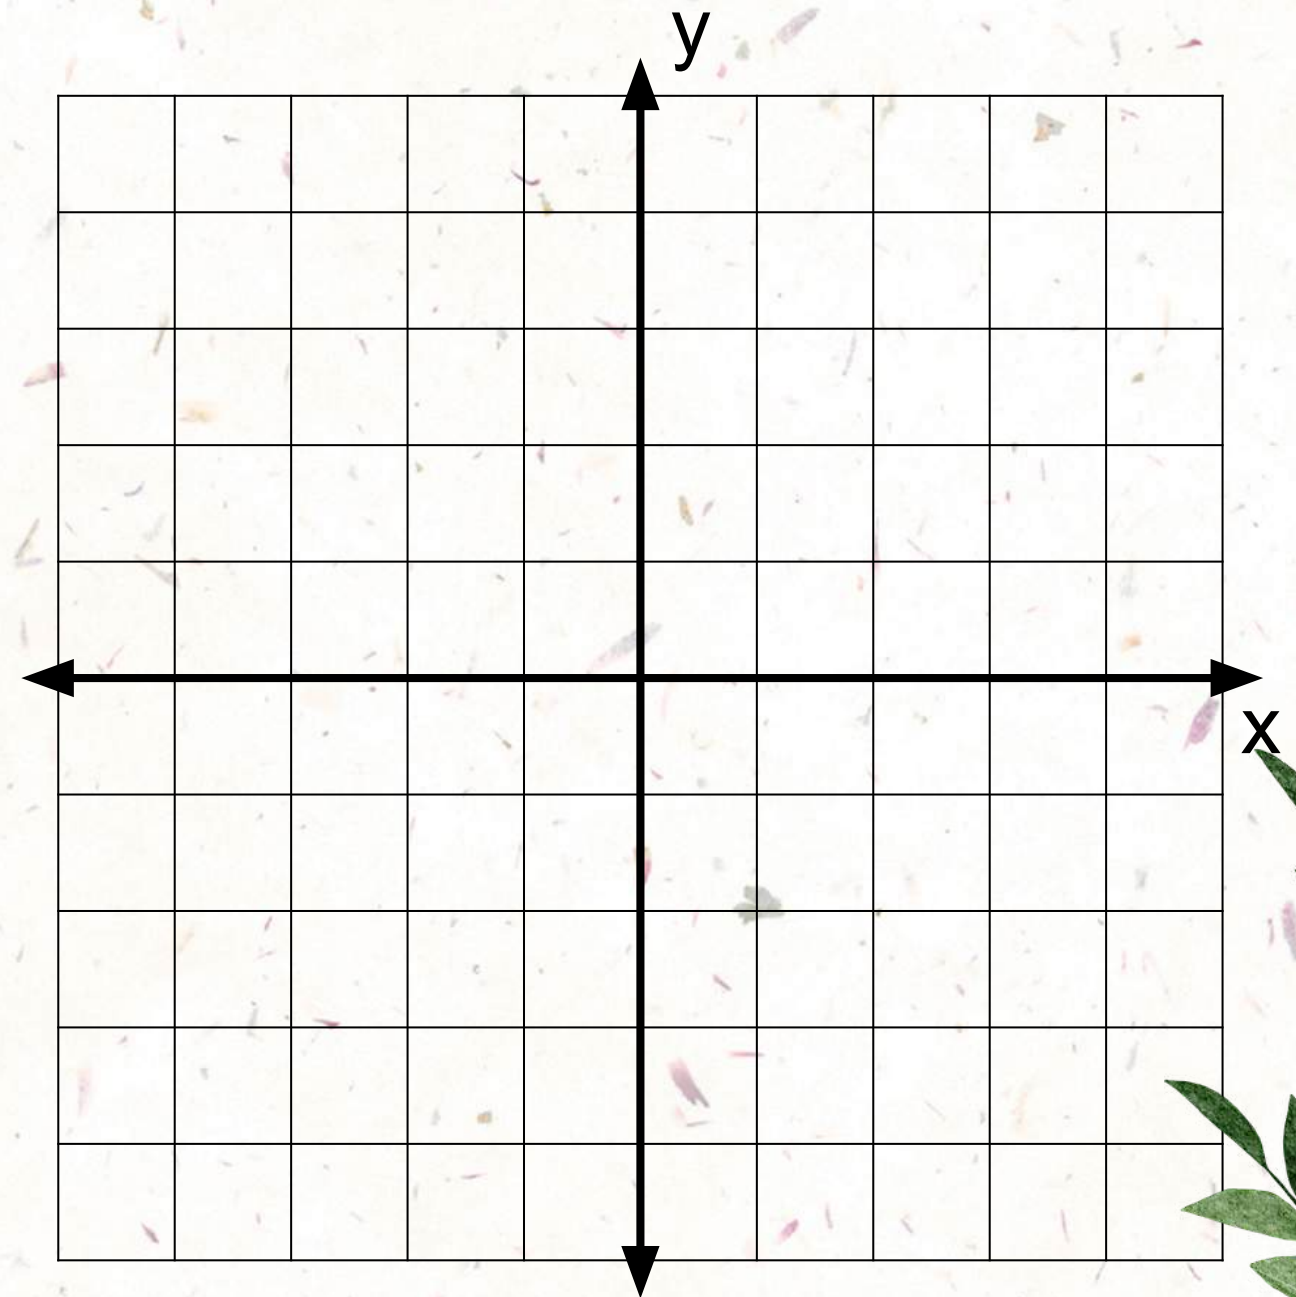

● (3, 2)

Your Turn!

Plot these points on the grid!

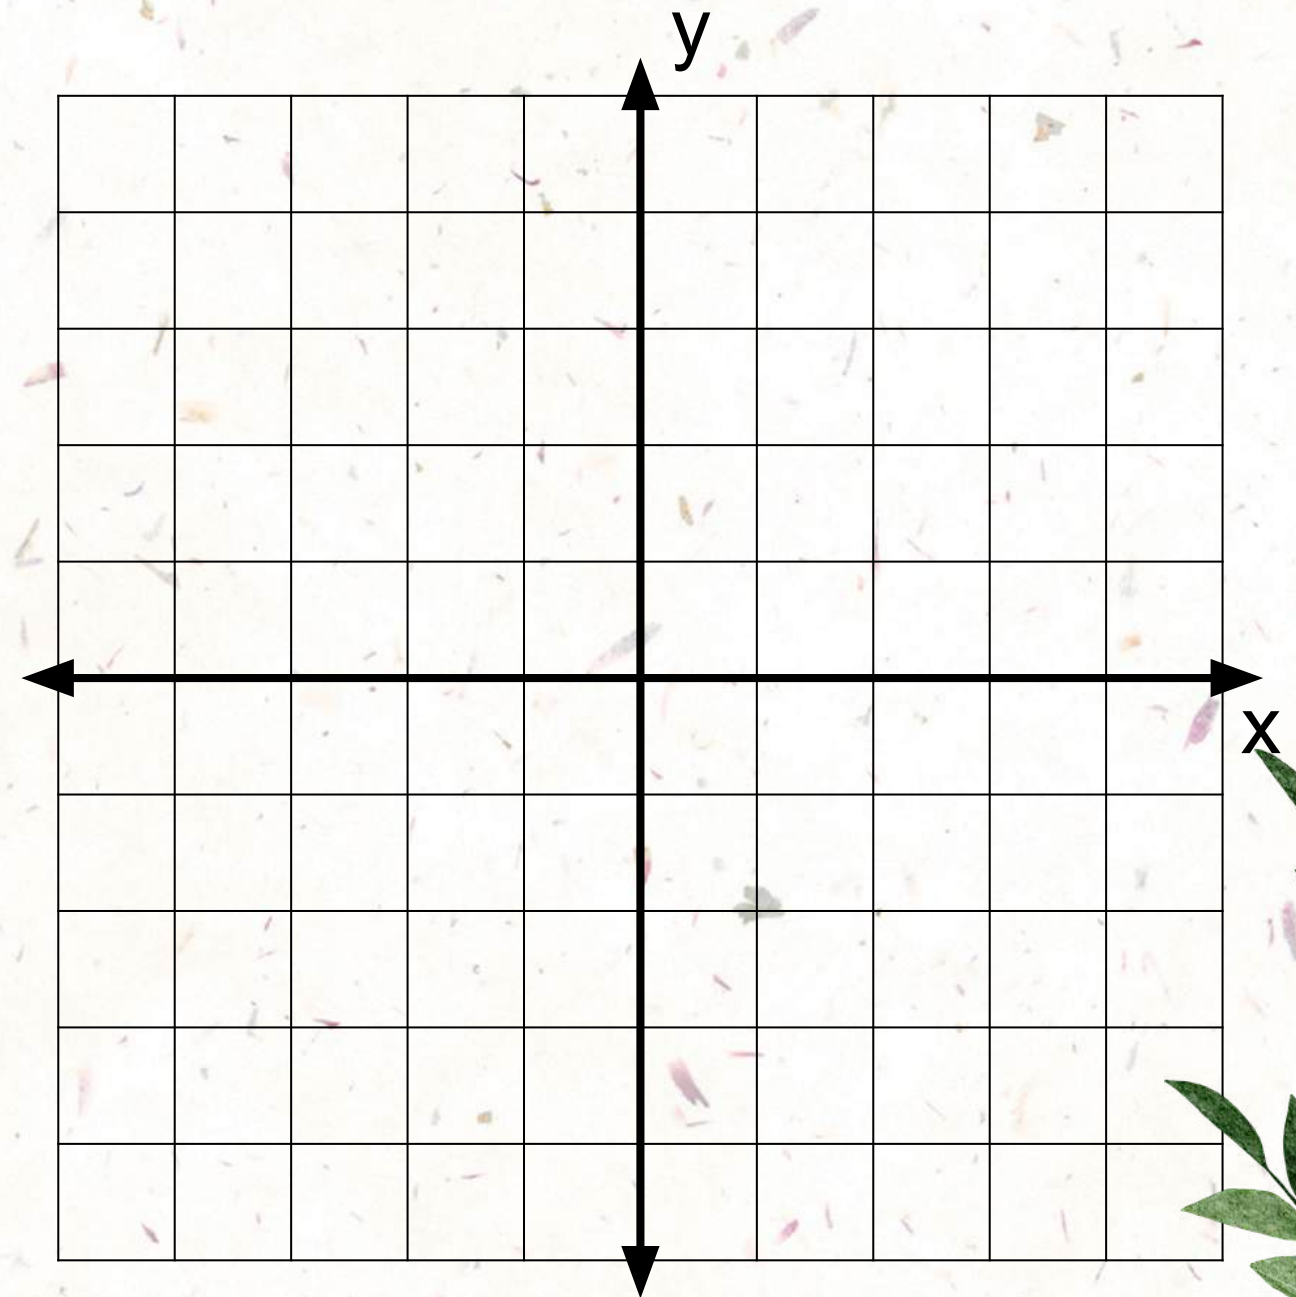

● **$(1, 4)$, $(2, 3)$, $(4, 1)$**

Fun Challenge!

Connect the dots to make
a shape!

● $(2,1) \rightarrow (4,1) \rightarrow (4,3) \rightarrow (2,3)$

Great Job!

Remember: X goes across, Y goes up!
Keep practicing and you'll be a coordinate
superstar!
