

ROTTING & DECOMPOSITION — NATURE'S RECYCLERS

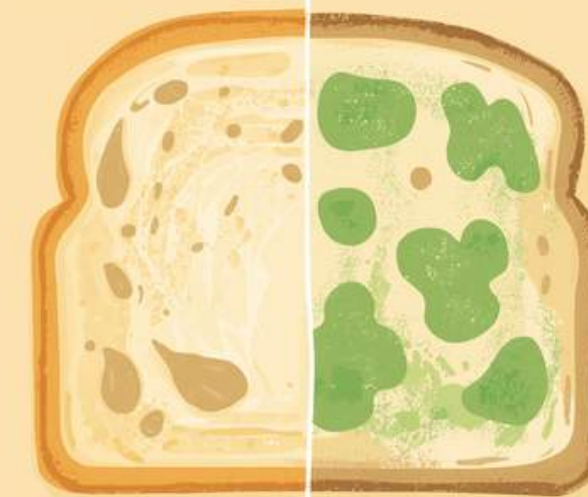

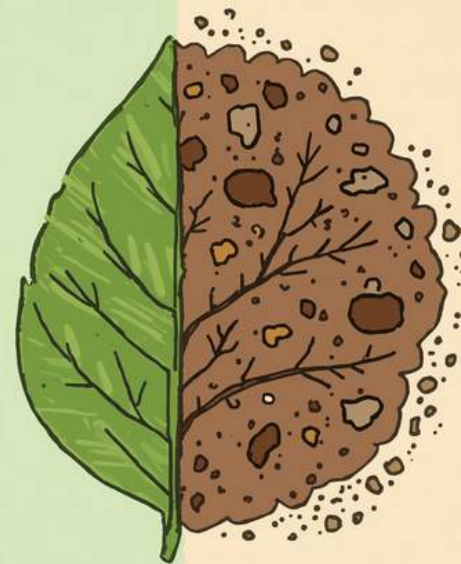

HAVE YOU SEEN THIS?

Rotting & Decomposition

What happened? Why does this happen? This is called
DECOMPOSITION — nature's recyclers!

What is Decomposition?

NATURE'S WAY OF RECYCLING

When something that was once alive breaks down slowly into tiny pieces and goes back into the soil. This is how nature cleans up and recycles!

@PLANRS ACADEMY

DECOMPOSITION PROCESS

MEET THE DECOMPOSERS — NATURE'S TINY HELPERS

BACTERIA BOBBY
Tiny helpers
everywhere!

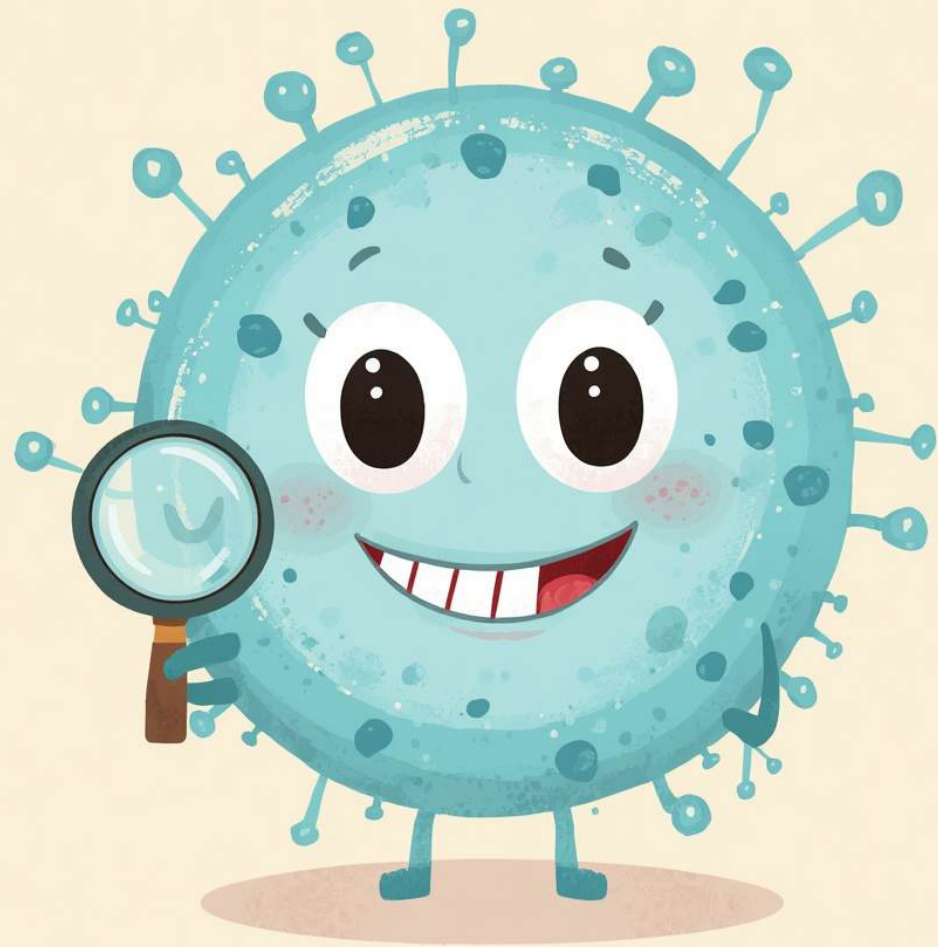

FUNGI FARIDA
The fuzzy friend!

WORM WARRIOR
“Earthworm” Raja!

BACTERIA BOBBY — TINY AND EVERYWHERE

Meet the Decomposers

Indian Example: Milk turns sour!

Too tiny to see without a microscope! Found in soil, water, and air. A million bacteria can fit on one grain of rice! 

FUNGI FARIDA — THE FUZZY FRIEND

White, green, or black fuzzy patches grow on bread, rotis, and fruit. During monsoon, mould appears on bread. Mushrooms grow on rotting wood and cow dung!

Meet the Decomposers

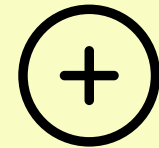

WORM WARRIOR (KENCHUE RAJA)

Meet the Decomposers

Lives in soil, eats dead leaves and makes soil rich!
After monsoon rains, earthworms come out to play.
Termites help break down old wood too!

Soil's Super Helper!

**Cleans dead matter
from forests and
gardens.**

**Returns nutrients
back into the soil.**

**Helps plants grow
strong and healthy.**

**Keeps our
environment clean
and balanced.**

WHY IS DECOMPOSITION IMPORTANT?

Nature's Recycling Loop

Nature's Friends!

WHAT DECOMPOSES? SORTING TIME!

Things that DECOMPOSE: mango peel, banana peel, cooked food, leaves, marigold flowers, paper, cotton cloth

Things that do NOT decompose: plastic bags, glass, aluminium cans, synthetic fabrics

NATURE'S HELPERS AT HOME

Kitchen waste and garden leaves become compost.
Banana leaves decompose quickly — eco-friendly! Cow
dung is natural fertiliser for healthy soil.

COMMON MISCONCEPTIONS ABOUT ROTTING

Let's clear up some myths!

Rotting is NOT bad — it helps nature recycle! Not only food rots — leaves, wood, and paper decompose too.

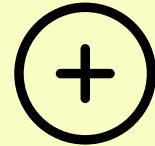

Bacteria can be helpful decomposers, not only harmful. Rot = recycling = life = plants = food! 🌱

FIVE KEY WORDS TO REMEMBER

Nature's Recyclers Vocabulary

DECOMPOSITION —
breaking down of dead
matter

DECOMPOSERS —
living things that break
matter down

BACTERIA — tiny invisible
decomposers

FUNGI — fuzzy
decomposers (mould)

Let's Chant Together!

**SAY IT LOUD
AND PROUD!**

Decomposers break it down, break it down,
break it down! Decomposers put it back in the
ground! 🌍

Thank you for learning how nature recycles! Let's respect and protect our decomposers. Keep watching how nature works around you! 🌍🌱

THANK YOU!
