

THE MAGIC OF MISHRI: GROWING YOUR FIRST CRYSTAL

SIMRAN & DADA-JI'S CRYSTAL SCIENCE ADVENTURE ✨

MEET SIMRAN & DADA-JI'S MISHRI MISSION!

At the temple, Dada-ji gave Simran a piece of Mishri prasad. "Dada-ji, why does Mishri look like tiny sparkling rocks?" she asked. That one question started a magical science adventure!  Mission: Become a Crystal Scientist!

WHAT IS A CRYSTAL?

A crystal is a super neat, repeating pattern of molecules — like Barfi pieces stacked perfectly in a sweet shop!

- ✦ Crystals form when molecules march in neat lines.
- ✦ They create flat surfaces and sharp, sparkly corners.
- ✦ That's why Mishri looks so beautiful and shiny!

THE MOLECULAR DANCE

Molecules have a secret dance routine — here's how they move to make crystals!

1

Molecules line up like
Barfi pieces in a
halwai's display

2

They create flat
surfaces and sharp
corners

3

This pattern makes
crystals sparkle and
grow!

SATURATED VS. SUPERSATURATED!

- 💡 Hot water can hold MORE sugar — just like making Chashni for Jalebi!
- ✅ Saturated = Water full of sugar at room temperature (no more sugar can dissolve!)
- ★ Supersaturated = Hot water holding EXTRA sugar — ready to grow beautiful crystals!
- 💡 The more sugar packed in, the bigger your Mishri crystals will grow!

THE STARTING POINT: NUCLEATION

Crystals need a 'seed' or rough surface to start growing!

Traditional Mishri is made by hanging cotton threads in sugar syrup — the thread gives crystals a place to begin!

⚠️ Safety Reminder: Ask a Parent to Help with hot water!

MATERIALS YOU'LL NEED!

1

1 cup water + 3 cups sugar (Mishri or regular)

2

Clean cotton thread & a pencil

3

Clear glass or steel tumbler

4

An adult to help with hot water!

STEP-BY-STEP SETUP

1

Boil 1 cup water with adult help

2

Stir in 3 cups sugar until fully dissolved

3

Dip cotton thread in sugar, tie to pencil

4

Place in a quiet corner and wait 5-7 days!

CRYSTAL LAB

- Use a safe, quiet spot away from dust and disturbance
- Avoid moving the tumbler once set up
- Keep checking daily but don't touch the crystals!

CRYSTAL GROWTH TIMELINE

Watch your Mishri crystals grow over 5–7 days — here's what to expect!

Day 1–2

Solution cools down &
tiny seeds start forming
on the thread

Day 3–5

Crystals begin to grow
bigger — you can see
them sparkling!

Day 6–7

Beautiful Mishri crystals
are ready — your
experiment worked!

TRACK YOUR CRYSTAL JOURNEY!

Use your Crystal Daily Diary on the Planrs App to upload photos and watch your Mishri crystal grow day by day!

- 📷 Take a photo each day
- 📝 Write your observations
- ★ Become a Crystal Scientist!

TIME FOR THE ROCKET QUIZ!

Let's see what you remember!

Answer the next 3 questions to become a Crystal Cadet. 🚀

QUIZ QUESTION 1

What is a crystal made of?

Random
molecules

Molecules in a
neat, repeating
pattern

Only sugar
cubes

QUIZ QUESTION 2

Why can hot water hold more sugar than cold water?

Hot water is
magic

Hot water can
dissolve more sugar
molecules

Cold water is
sweeter

QUIZ QUESTION 3

What helps crystals start growing?

A seed or rough
surface

A spoon

Cold air

THANK YOU & HAPPY CRYSTAL GROWING!

Have fun growing your crystals safely!
Ask your parents for help and share your
crystal photos on the Planrs app!
