

Hello Python — Your First Text Program!

Grade 3 | Coding

Let's write our first program together!

What is Python?

Python is a programming language.

It tells the computer what to do – step by step!

Python is used to make games, apps, and websites.

It was named after a comedy show, not a snake! 🐍

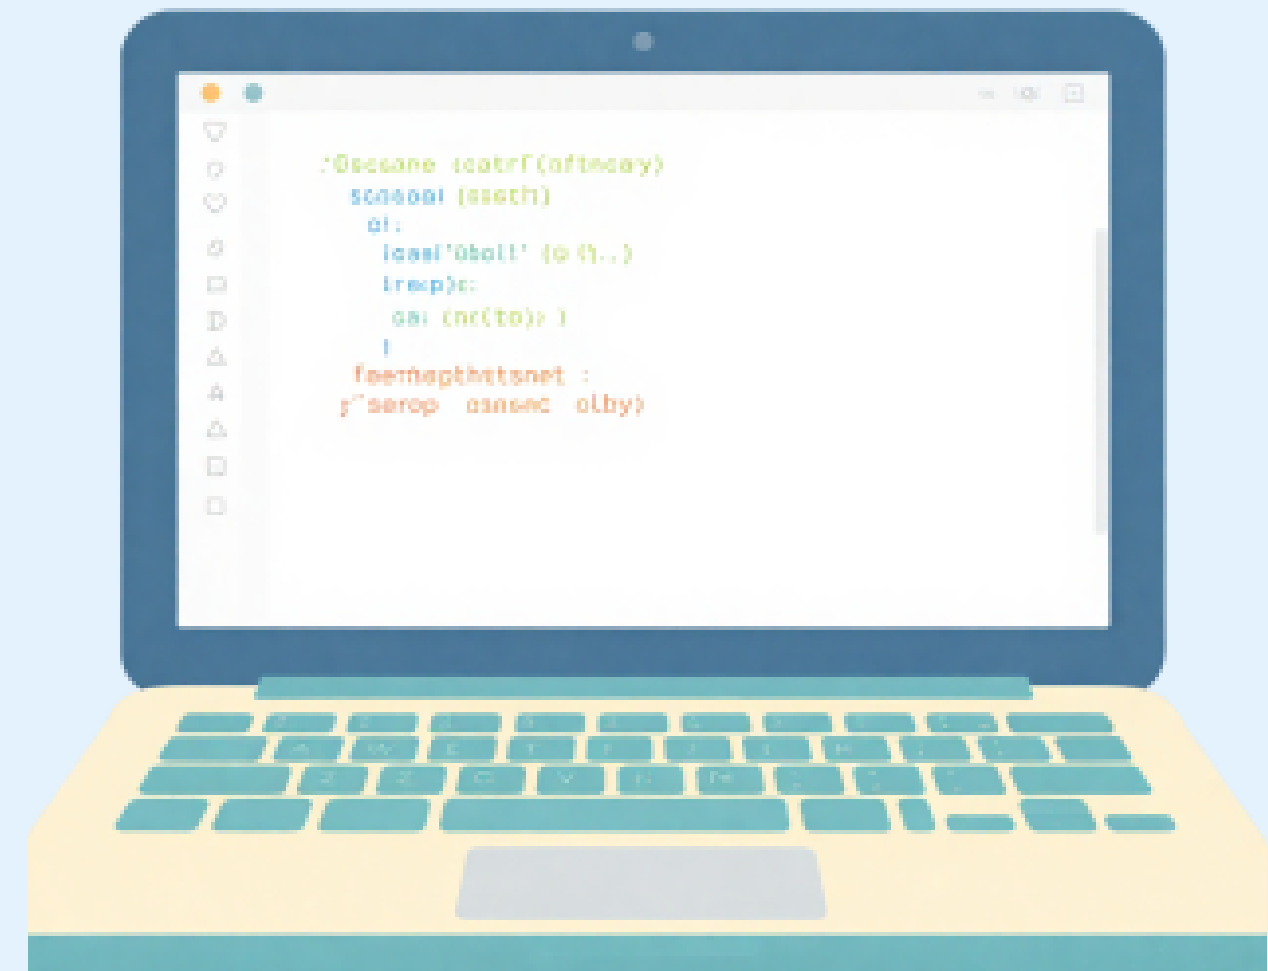

Where Do We Write Python?

We use an editor to type our code.

You can use Thonny, IDLE, or an online editor.

The editor is where we give instructions to Python.

Ask your teacher which one to open!

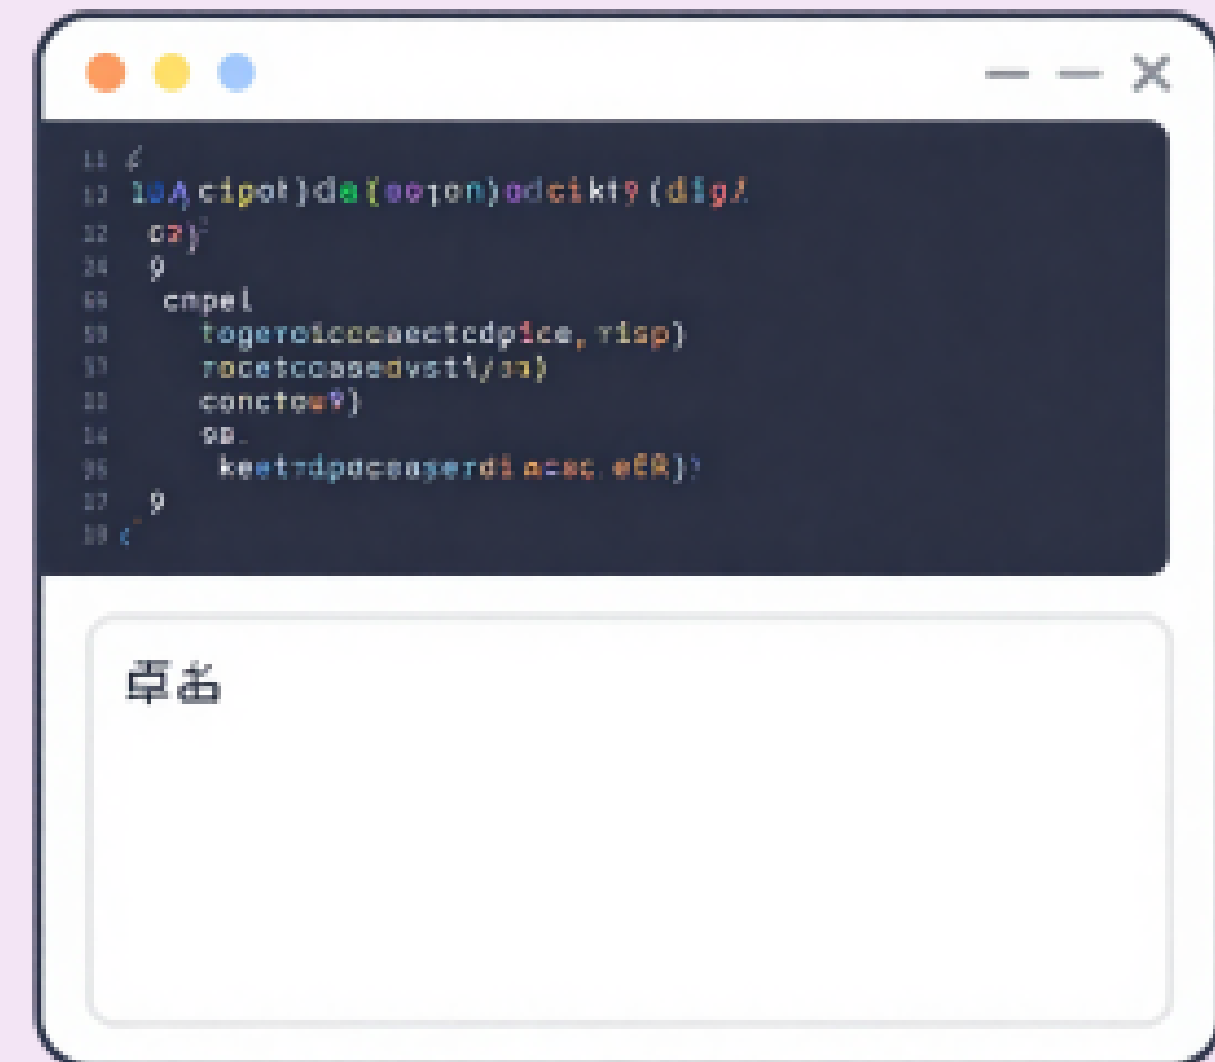

Meet the Python Editor

The editor has two parts:

- Code area – where you type your instructions
- Output area – where results appear

Type your code, press Run, and see the magic!

Your First Command: print()

`print()` is a command that shows text on screen.
Whatever you put inside the brackets appears!

Example:

```
print("Hello, World!")
```

Let's Try It!

Type this in your editor:

```
print("Hello, World!")
```

Press Run. What do you see?

The computer says: Hello, World! 🎉

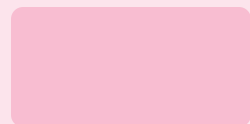

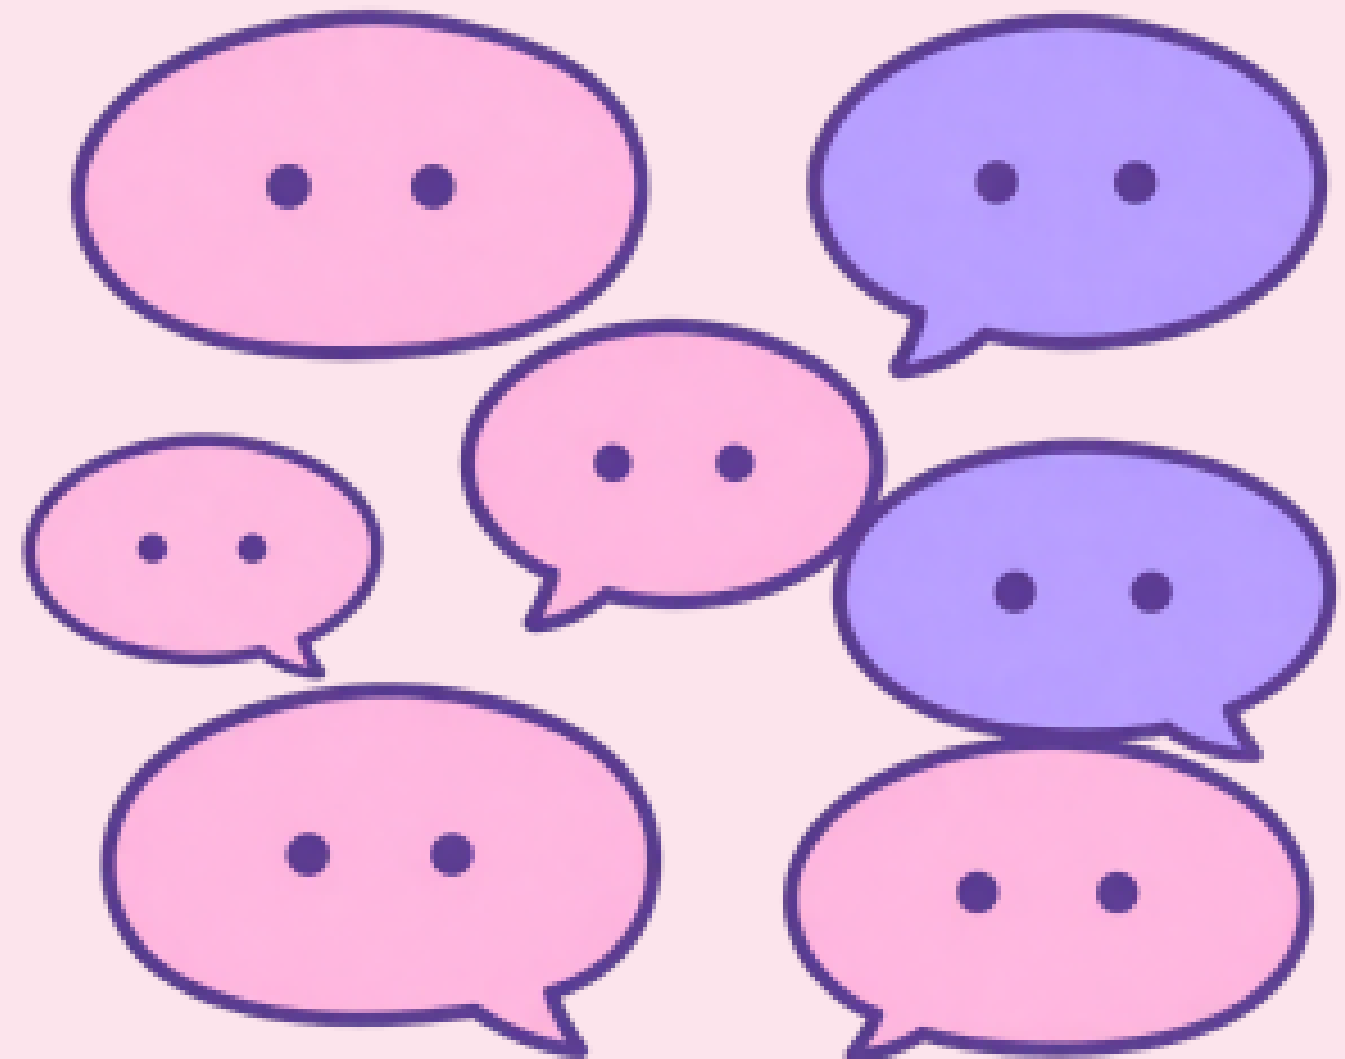

What Are Strings?

A string is text inside quotes.

"Hello" is a string.

"Python is fun" is also a string.

Strings are always inside " " or ' '

Strings Need Quotes!

Right: `print("Hi there!")`

Wrong: `print(Hi there!)`

Without quotes, Python gets confused!

Always wrap your text in quotes. ✓

Let's Print More!

Try these:

```
print("My name is Python")  
print("I am learning to code")  
print("This is so cool!")
```

Each print() makes a new line!

Common Mistakes

Forgetting quotes:

```
print(Hello) ← Error!
```

Forgetting brackets:

```
print "Hello" ← Error!
```

Always use: `print("text")`

Fix the Bug!

Can you spot the mistake?

```
print(Good morning)
```

Fix: `print("Good morning")`

The quotes were missing! 🔍

Variables — Giving Names to Things

A variable stores information.

```
name = "Aarav"
```

```
age = 8
```

Now 'name' holds "Aarav" and 'age' holds 8!

Variables are like labelled boxes. 📦

Print with Variables

```
name = "Priya"  
print(name)
```

Output: Priya

The variable gives its value to print()!
No quotes around the variable name.

Mini Challenge!

Write a program that prints:

1. Your name
2. Your favourite food
3. Your favourite colour

Use `print()` three times! 🏆

What Did We Learn Today?

- ✓ `print()` shows text on screen
- ✓ Strings go inside quotes
- ✓ Variables store information
- ✓ We can print variables too!
- ✓ Always check for missing quotes!

Keep Coding!

You wrote your first Python program! 🎉
Keep practising – try printing fun messages.

Next class: Input – asking the user questions!
See you soon, coder! 🐍
