

Create Your Own Personalised Report Card!

Let's learn Python and make coding fun!

What is a Report Card?

A report card shows how well you did in your school subjects!

Common subjects:

- Maths
- Science
- English
- Hindi
- Computer Science

What is Coding?

Coding means telling the computer what to do, step by step — like giving instructions to a friend!

- Coding is fun and creative
- It helps us solve problems
- Today we will use Python!

Meet Python!

Python is like a language for computers.
It's easy and fun to learn!

Try this simple command:

```
print("Hello!")
```

This tells the computer to show the word Hello! on screen.

Variables: Storing Information

A variable is like a box that holds information.
You give it a name and put something inside!

Example:

```
name = "Anaya"
```

Here, "name" is the box and "Anaya" is what we put inside!

Input: Asking Questions

We can ask you questions and store your answers using `input()`!

Example:

```
name = input("What is your name? ")
```

The computer asks a question and waits for you to type!

Print Statements: Showing Messages

print() tells the computer to show words or information on the screen!

Example:

```
print("Welcome, " + name)
```

This shows a welcome message with the student's name!

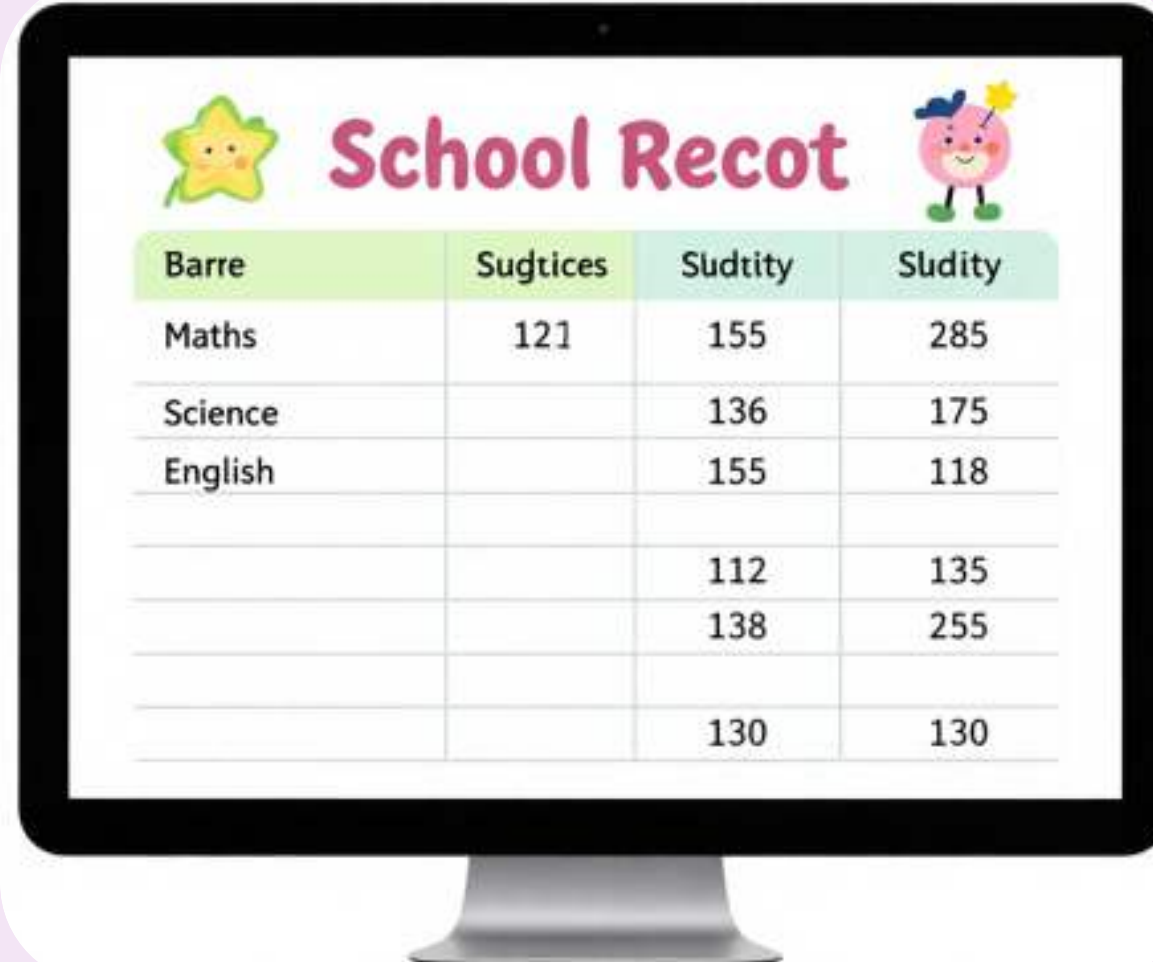

Project Overview

We will write code that makes a personalised report card just for you!

Our program will:

- Ask for your name
- Ask for your marks in each subject
- Show your complete report card
- Say 'Well done!' at the end

Barre	Sugtices	Sudtity	Sludity
Maths	121	155	285
Science		136	175
English		155	118
		112	135
		138	255
		130	130

Step 1: Asking for Your Name

First, we ask the student to type their name.
The computer stores it in a variable!

Code:

```
name = input("Enter your name: ")
```

When you run this, the computer waits for you to type your name!

Step 2: Getting Your Marks

Next, we ask for marks in each subject.
The computer saves each one!

Code:

```
math = input("Enter Math marks: ")  
science = input("Enter Science marks: ")  
english = input("Enter English marks: ")
```

Each subject gets its own variable to store the marks!

Step 3: Showing Your Report Card

Now we print the report card using all the information we collected!

Example:

```
print("Name: " + name)
print("Maths: " + math)
print("Science: " + science)
```

The computer shows a neat report card on the screen!

Step 4: Saying Well Done!

Let's add a congratulatory message to cheer the student!

Example:

```
print("Great job, " + name + "!!")
```

This makes the student feel happy and proud!

Try It Yourself!

Now it's your turn!

Run the program and try changing the inputs.

Try these ideas:

- Change the name to your own name
- Add different subjects
- Change the marks to your real marks
- Add a fun message at the end!

How to Personalise Your Report Card

Make your report card unique and fun!

Ideas to try:

- Add more subjects (Art, Music, Sports)
- Change the messages to be funny or kind
- Add emojis in your print statements
- Use colours in your output
- Add a grade (A, B, C) based on marks

Summary: What We Learned

Today we learned:

- Coding is fun and helps us make useful programs
- Python uses variables to store information
- `input()` asks questions to the user
- `print()` shows messages on the screen
- We created a personalised report card!

Keep Coding and Have Fun!

"Coding is a superpower —
keep practicing and creating!"

Thank you for learning with us!
Any questions? Let's discuss!
