

PROBABILITY

THEORETICAL VS EXPERIMENTAL

LET'S EXPLORE THE EXCITING WORLD OF CHANCE!

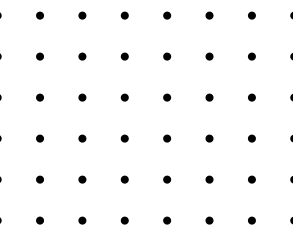

WHAT IS PROBABILITY?

UNDERSTANDING CHANCE AND LIKELIHOOD

Probability tells us how likely something is to happen!
When you flip a coin, will it land on heads or tails?
When you roll a dice, which number will come up?
These are questions about chance. Probability helps us
predict and understand the outcomes of everyday
events around us.

THEORETICAL PROBABILITY

Theoretical probability tells us what SHOULD happen based on maths! When you flip a fair coin, there are 2 possible outcomes - heads or tails. So the chance of getting heads is 1 out of 2, which is 50%. This is what we EXPECT to happen when we calculate using maths.

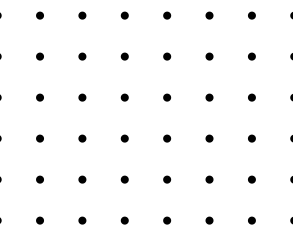

50% CHANCE!

PROBABILITY FUN

EXPERIMENTAL PROBABILITY

This is what ACTUALLY happens when we try it! When you flip a coin 20 times, you might not get exactly 10 heads and 10 tails. Maybe you get 12 heads and 8 tails - that's experimental probability! It's the result from real experiments we do ourselves.

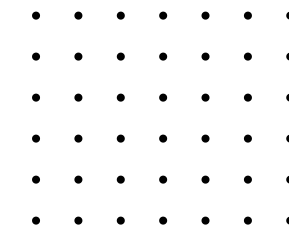

COMPARING BOTH TYPES

- ☑ Theoretical Probability uses math to predict outcomes - like knowing a coin has 50% chance of heads before flipping it!
- ☑ Experimental Probability uses real results from actual trials - the more times you flip, the closer you get to the prediction!
