

WINGS IN THE WIND: AEROFOILS & LIFT

Look Up!

Have you ever wondered how wings help things fly?

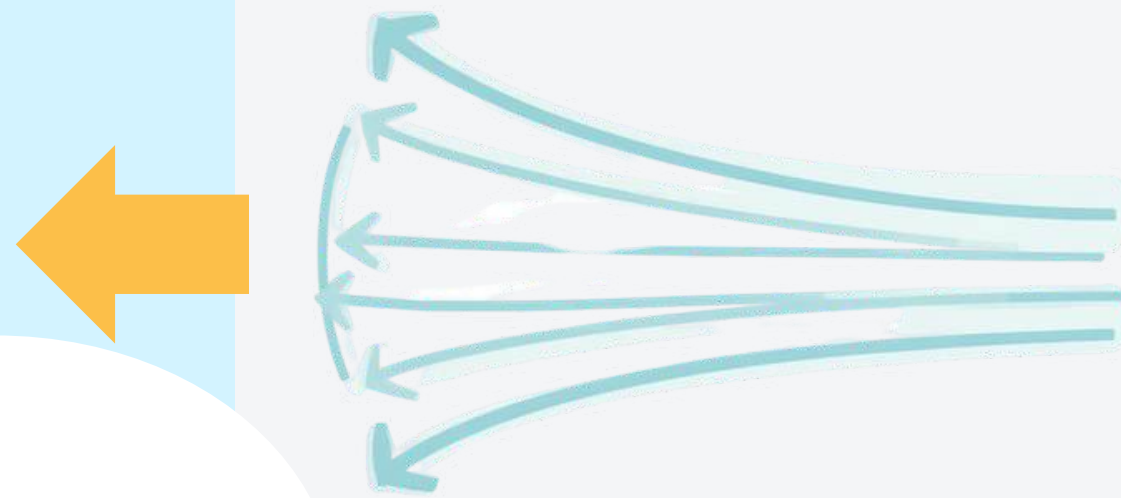

Birds, planes, and kites all use wings to soar through the sky!

WHAT IS AERODYNAMICS?

Aerodynamics is the science of how air moves around things.

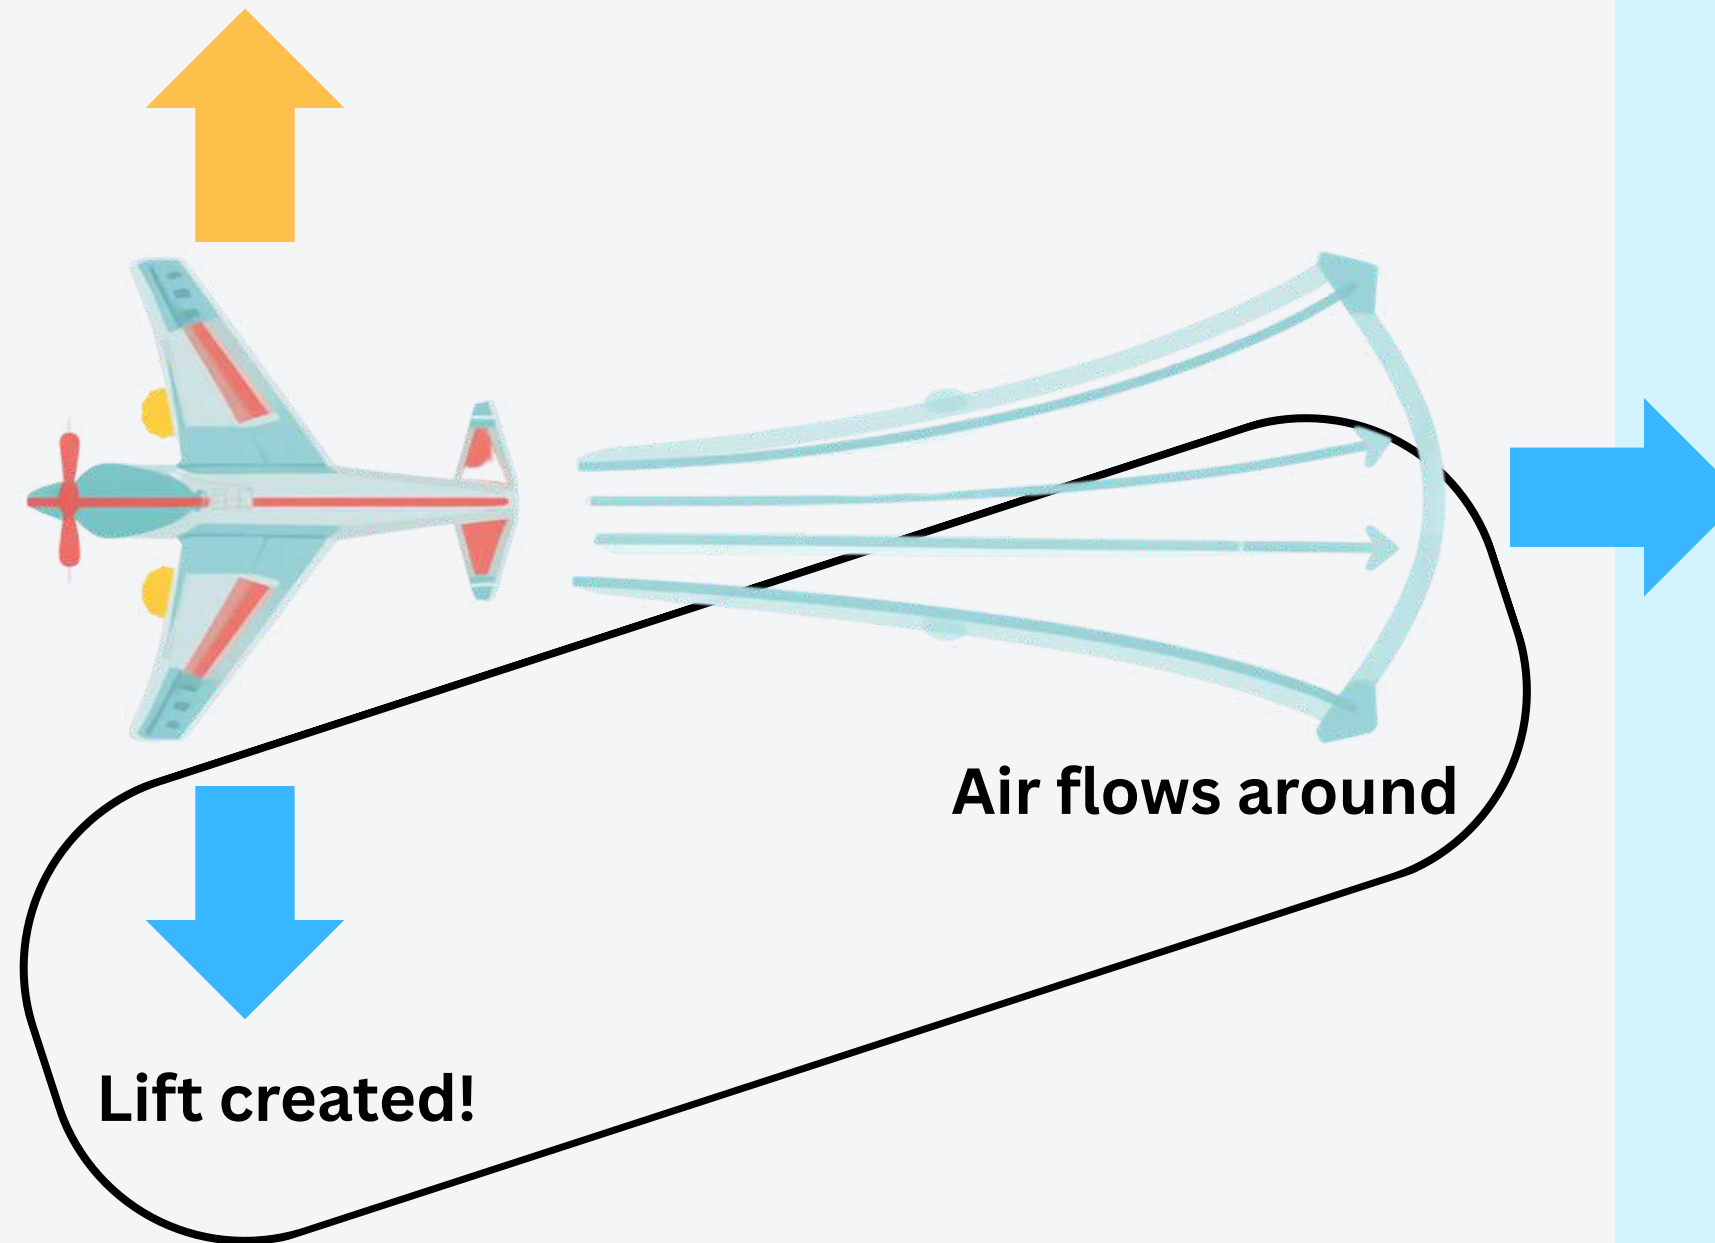

It helps us understand how birds, planes, and even kites fly!

When air flows around a wing, it creates forces that lift things up into the sky!

Air flows under

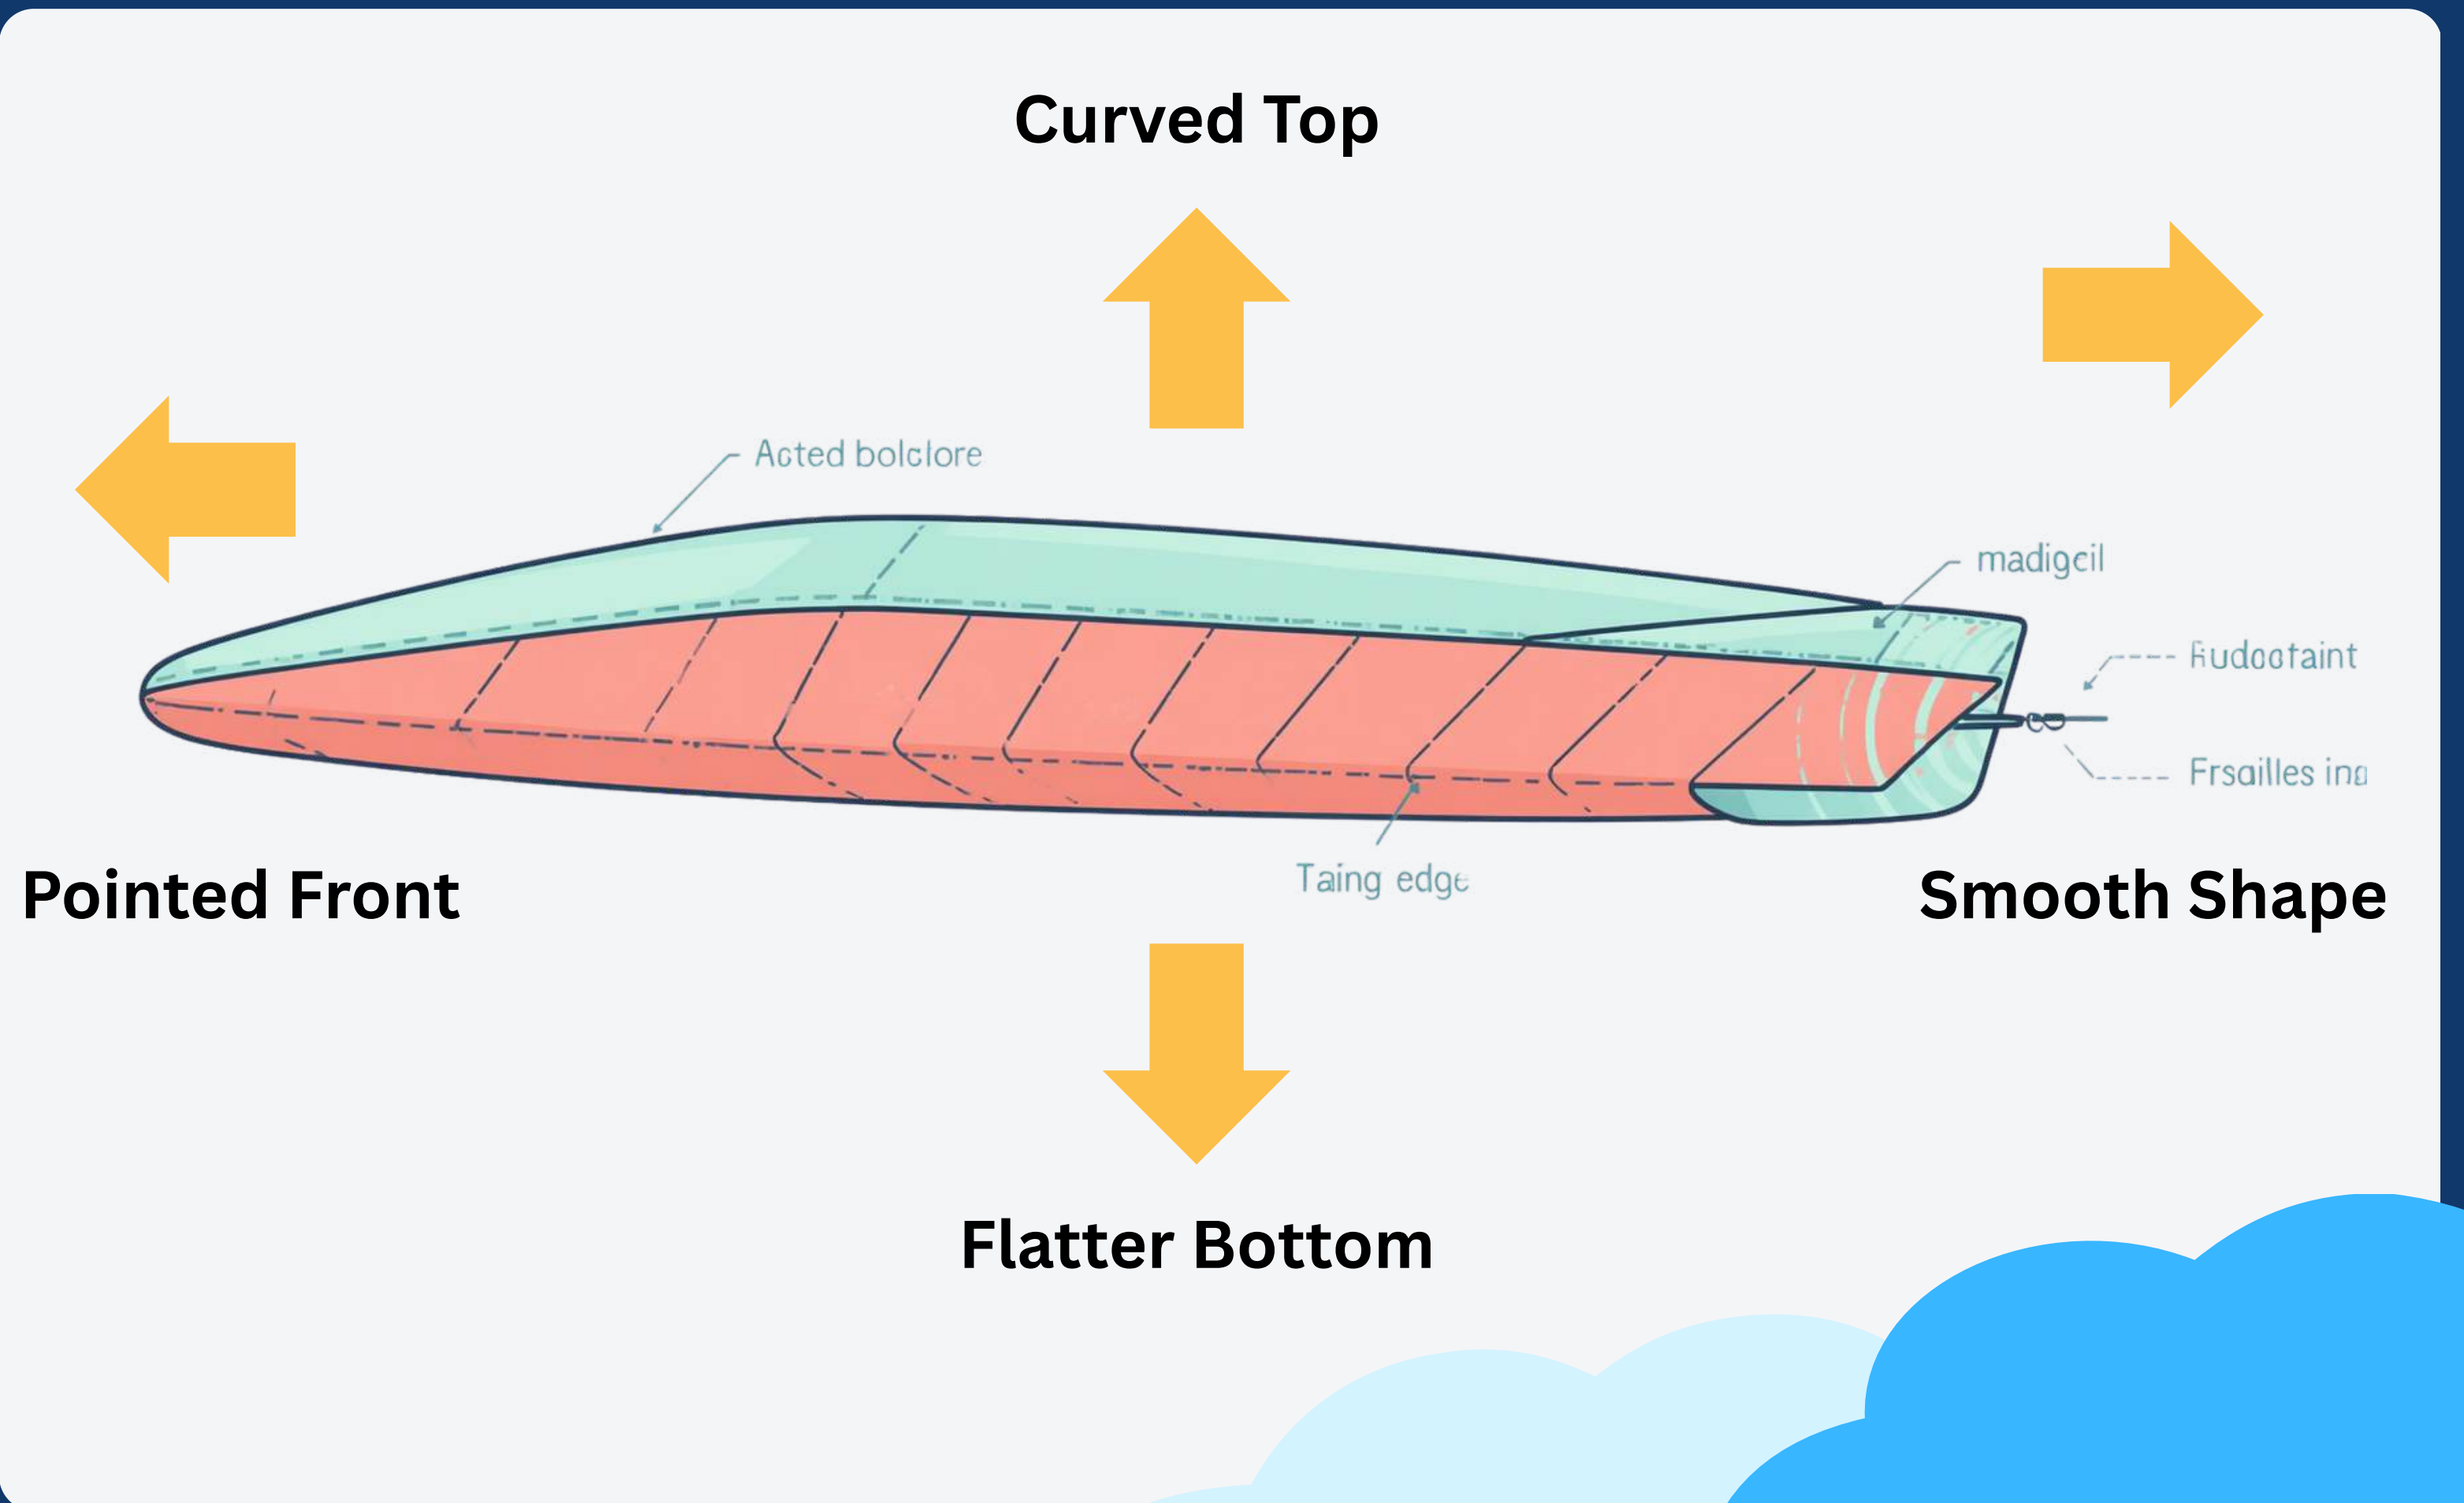

Air flows over

Lift created!

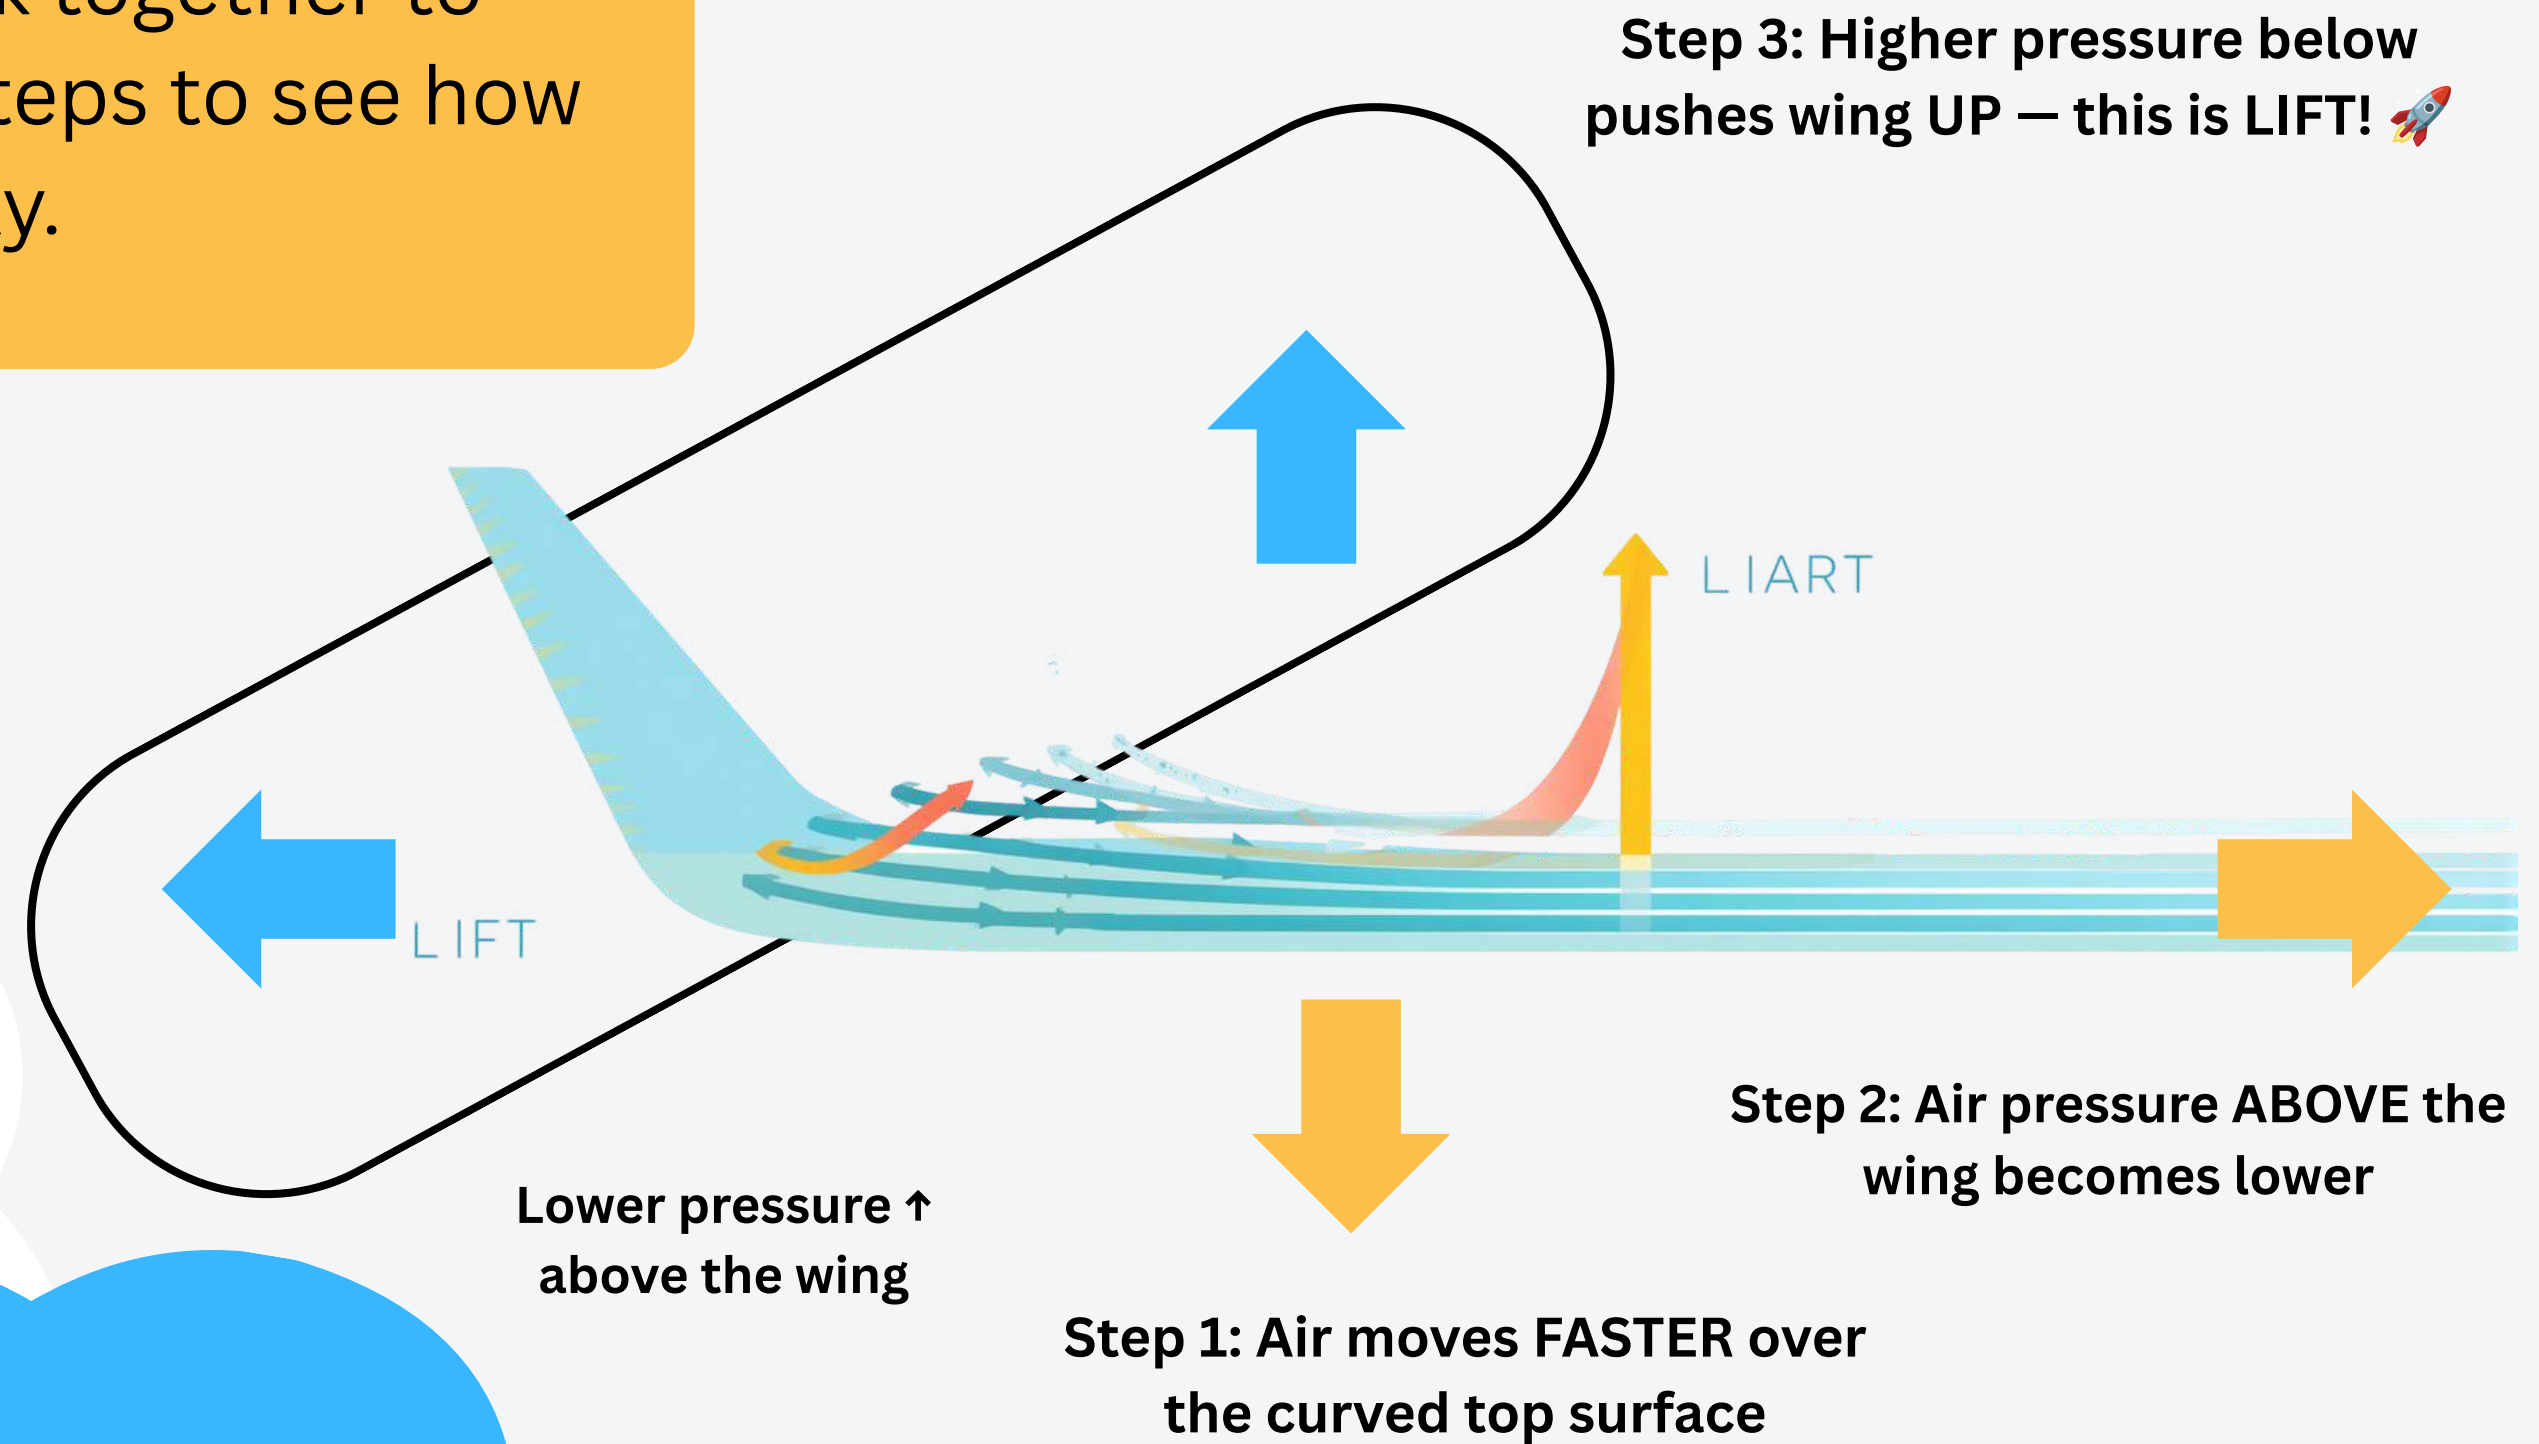

Air flows around

WING

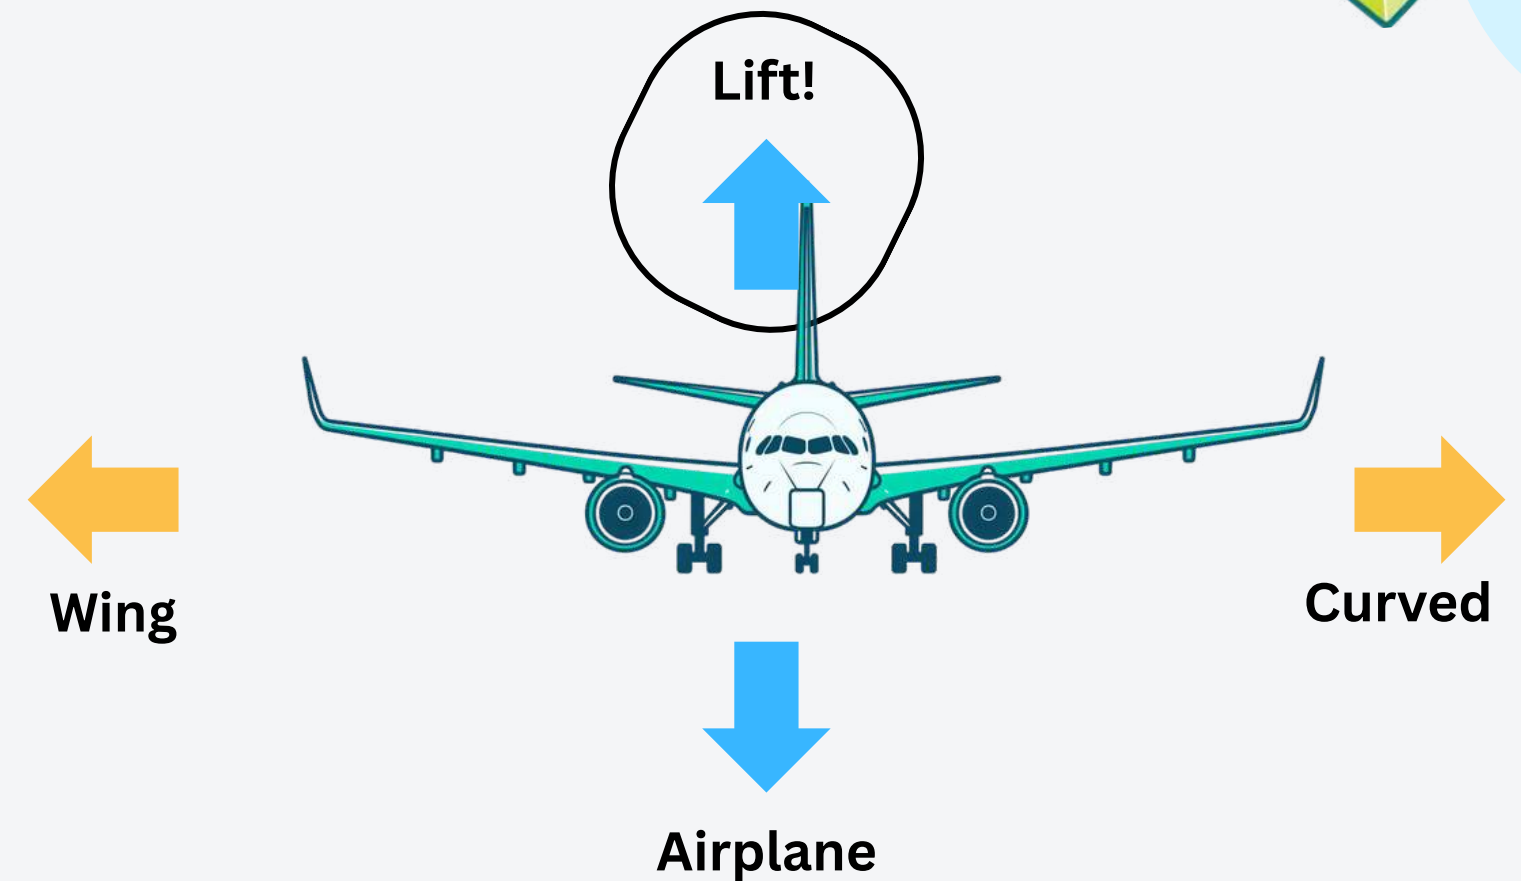

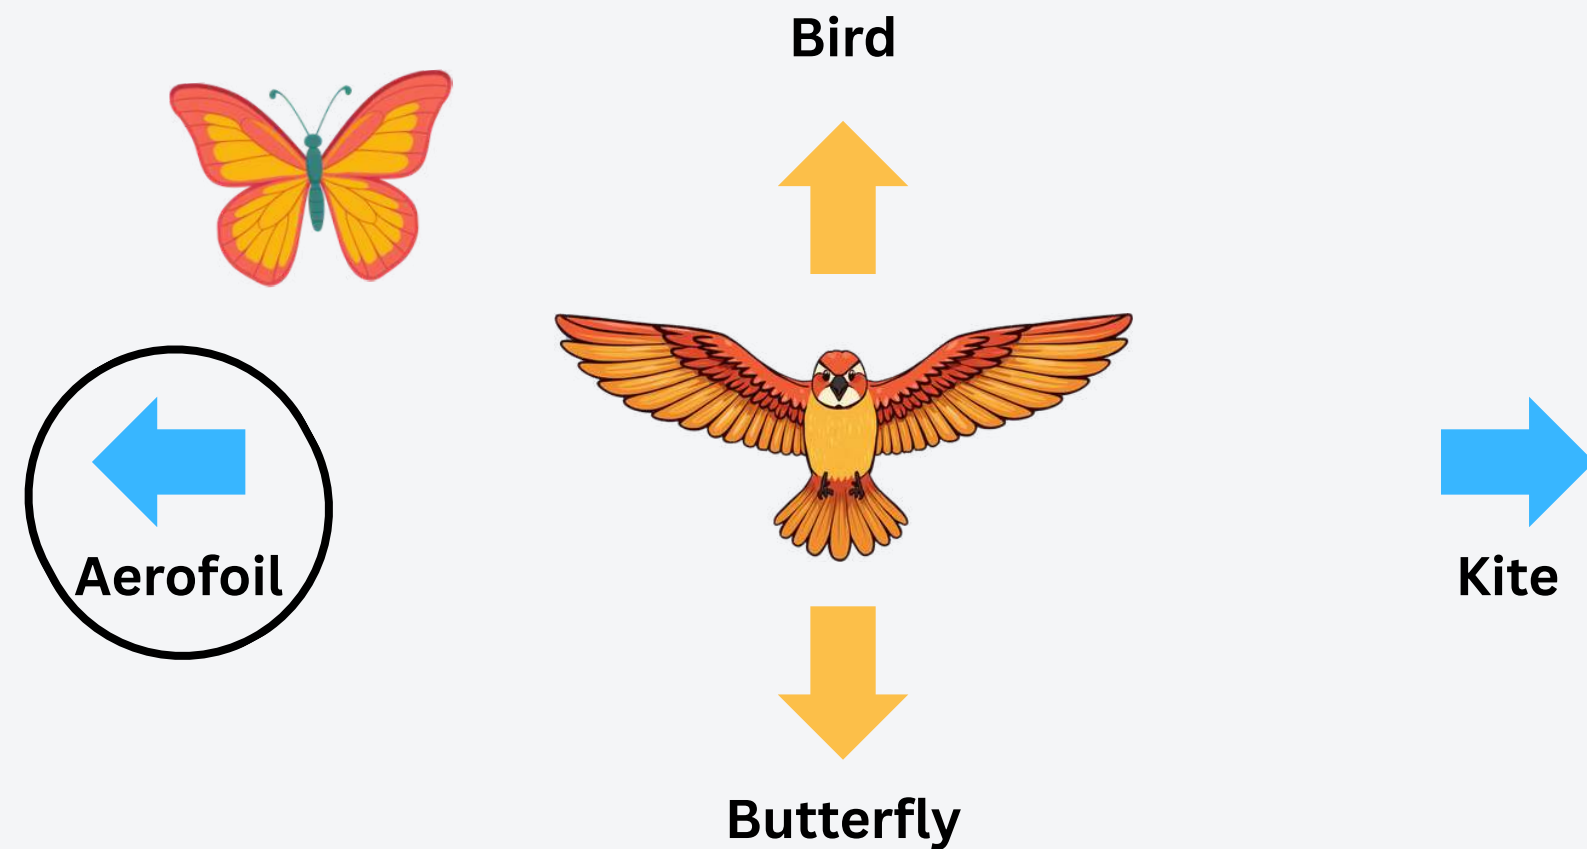

HOW DOES LIFT WORK?

Air and wing shape work together to create lift! Follow the steps to see how a plane rises into the sky.

WINGS ALL AROUND US!

Many flying things use aerofoil wings to lift off and stay in the air!

From birds to butterflies, kites to planes – aerofoil shapes are everywhere in nature and engineering!

WING SHAPES: WITH & WITHOUT AEROFOIL

Flat Wing

No aerofoil shape

Less lift created!

Aerofoil Wing

Special curved shape

Creates more lift!

LET'S!

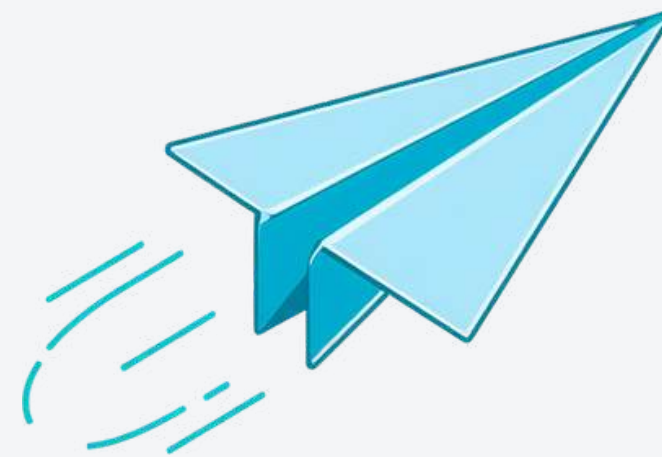

Make Your Own Paper Aerofoil!

Fold paper to make a curved wing shape

Blow air over the top and feel how it lifts

Try flying it like a plane!

You can do it — science is fun!

Did You Know? Birds flap their wings to create lift and move forward!

Every flap pushes air down and back — sending the bird up and forward through the sky!

RECAP

Let's Recap What We Learned!

Aerodynamics is how air moves around things

Aerofoil wings have a special curved shape

Lift happens because air moves faster over the wing top

Birds, planes, and kites all use aerofoils to fly!

THANK YOU!

**THANK YOU FOR FLYING WITH US
TODAY!**
