

T1 PYTHON PROJECT: NEWS HEADLINE TRACKER

TODAY'S MISSION: BECOME A NEWS DETECTIVE!

Imagine you are a news detective!
Your mission: find exciting news
words like ISRO, Cricket, or Weather
in headlines.

Can your Python program spot
these news words fast?

HOW OUR NEWS TRACKER WORKS!

We keep all headlines in a list — like a big newsbag!
We check each headline using a loop — like flipping TV channels.

-  Python list stores daily headlines
-  For loop scans headlines one by one
-  If statement checks for special words

STARTER CODE: OUR NEWS HEADLINES LIST

```
headlines = [  
    "ISRO launches new rocket",  
    "IPL cricket updates today",  
    "Delhi weather forecast",  
    "Neeraj Chopra wins gold",  
    "Dussehra celebrations begin"  
]
```

Each headline is a text item in the list.
Python stores text in quotes "".
Lists help us organize news for scanning!

LET'S SEARCH HEADLINES WITH YOUR INPUT!

Type your favourite news word (like ISRO or Cricket)
to search headlines!

- Use `input()` to get your search word
- For loop checks every headline
- If headline has your word, print an alert!

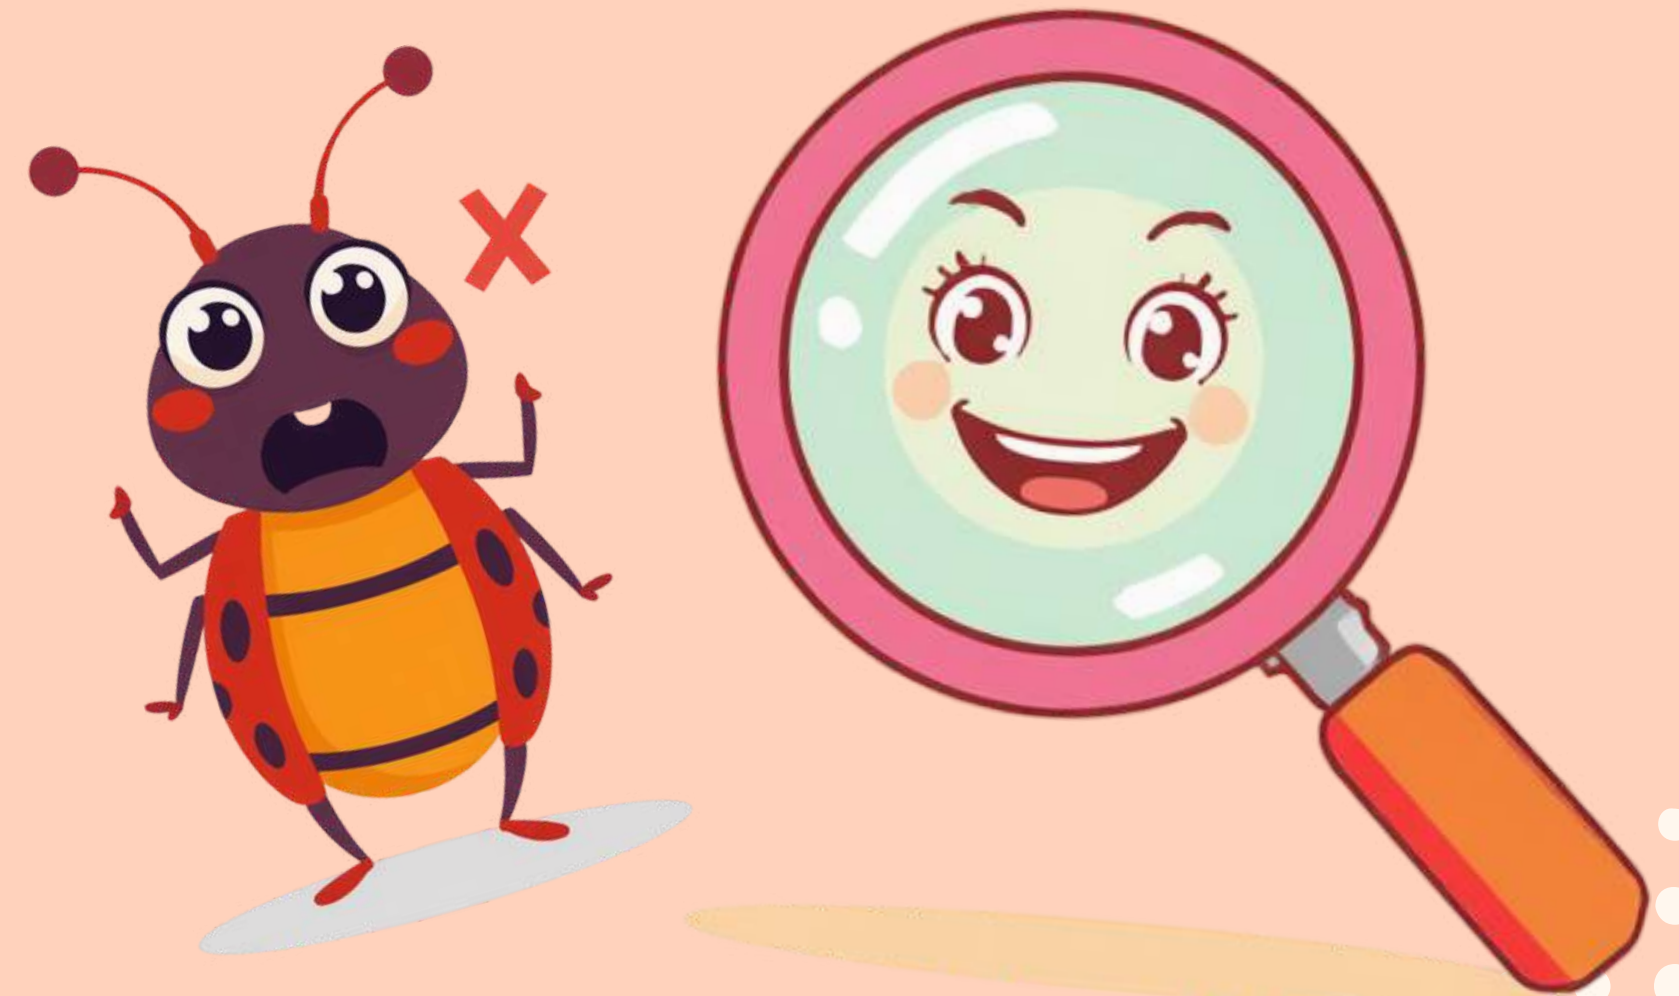

"Searching for 'Weather'... Found in headline #3!"

BUG-BUSTER CHALLENGE: FIX THE CODE!

Can you find the bugs? Check for missing colons and case mistakes!

- Python needs colons after loops and ifs
- Use lower() to ignore case differences
- Spot the bug and fix it to make your code work!

RECAP & YOUR NEXT NEWS MISSION!

- ✓ Use lists to store headlines
- ✓ For loops scan headlines quickly
- ✓ If statements check for keywords
- ✓ Use `input()` for dynamic search!
- 🔍 You're now a Python news detective — keep exploring!

THANK YOU & LET'S CODE!

Great job today! You are now a Python news detective! Ready for more Python fun? Keep exploring with Planrs Academy!
