

The Family Photo Album Mystery!

Ananya wonders why she has dimples like her Dadi. Let's find out!

What Are Traits?

Traits are special features you get from your family! They make you unique and help us understand how we're connected to our relatives.

Eye color

Hair type

Dimples & Tongue rolling

Inherited or Learned? Let's Play!

We will sort traits into two groups: Inherited (from family) or Learned (things you practice). Look at each trait and decide which group it belongs to!

Cycling - Learned

Brown eyes - Inherited

Playing Tabla - Learned

Examples of Inherited Traits

These special features come from your parents and grandparents! Let's see some inherited traits that make each family unique.

Brown eyes (Dominant)

Free earlobes (Dominant)

Dimples & Curly Hair (Dominant)

Examples of Learned Traits

These are skills you learn by practicing!
Family members teach these special abilities to the new generation.

Bharatanatyam dance from grandmother

Playing Sitar from grandfather

Cooking Dosa with aunties

Meet Gregor Mendel: The Trait Detective

Gregor Mendel was a scientist who studied how traits pass from parents to children using pea plants. Just like mango trees can have sweet or sour mangoes, traits come in different versions!

Dominant and Recessive Traits

Think of a mango orchard! Some mango trees are bossy and show their big mangoes proudly – these are Dominant Traits! Other trees are quiet and sometimes hide their mangoes – these are Recessive Traits!

Dominant traits are like loud, bossy trees

Recessive traits are quiet trees – sometimes hidden

Brown eyes are dominant; light eyes are recessive

Dominant or Recessive?

Let's compare some trait pairs! Dominant traits show up more often, while recessive traits are hidden unless both parents pass them down.

Brown eyes (Dominant) vs Light eyes (Recessive)

Free earlobes (Dominant) vs Attached earlobes (Recessive)

Dimples (Dominant) vs No dimples (Recessive)

Family Trait Detective: The Verma Family

Let's explore how traits pass through generations! Look at the Verma family across three generations and spot which traits they share.

Dada (Grandfather): Free earlobes

Dadi & Parents: Attached earlobes

Children: Mix of both types!

Self-Check: Your Traits

Let's discover your special traits! Try these fun activities to learn about yourself.

Try rolling your tongue – can you do it?

Look at your earlobes – are they free or attached?

Do you have dimples? Smile and check!

Quiz Time!

Let's test what we learned about traits! Read each question and choose the right answer.

Q1: Are brown eyes inherited or learned?

Q2: Which trait is dominant – dimples or no dimples?

Q3: Can tongue rolling be learned by practice?

Home Mission: Be a Family Trait Detective!

Ask 3 family members about their traits! Talk to your Dada, Dadi, or other relatives and find out what traits they have. Write down your discoveries!

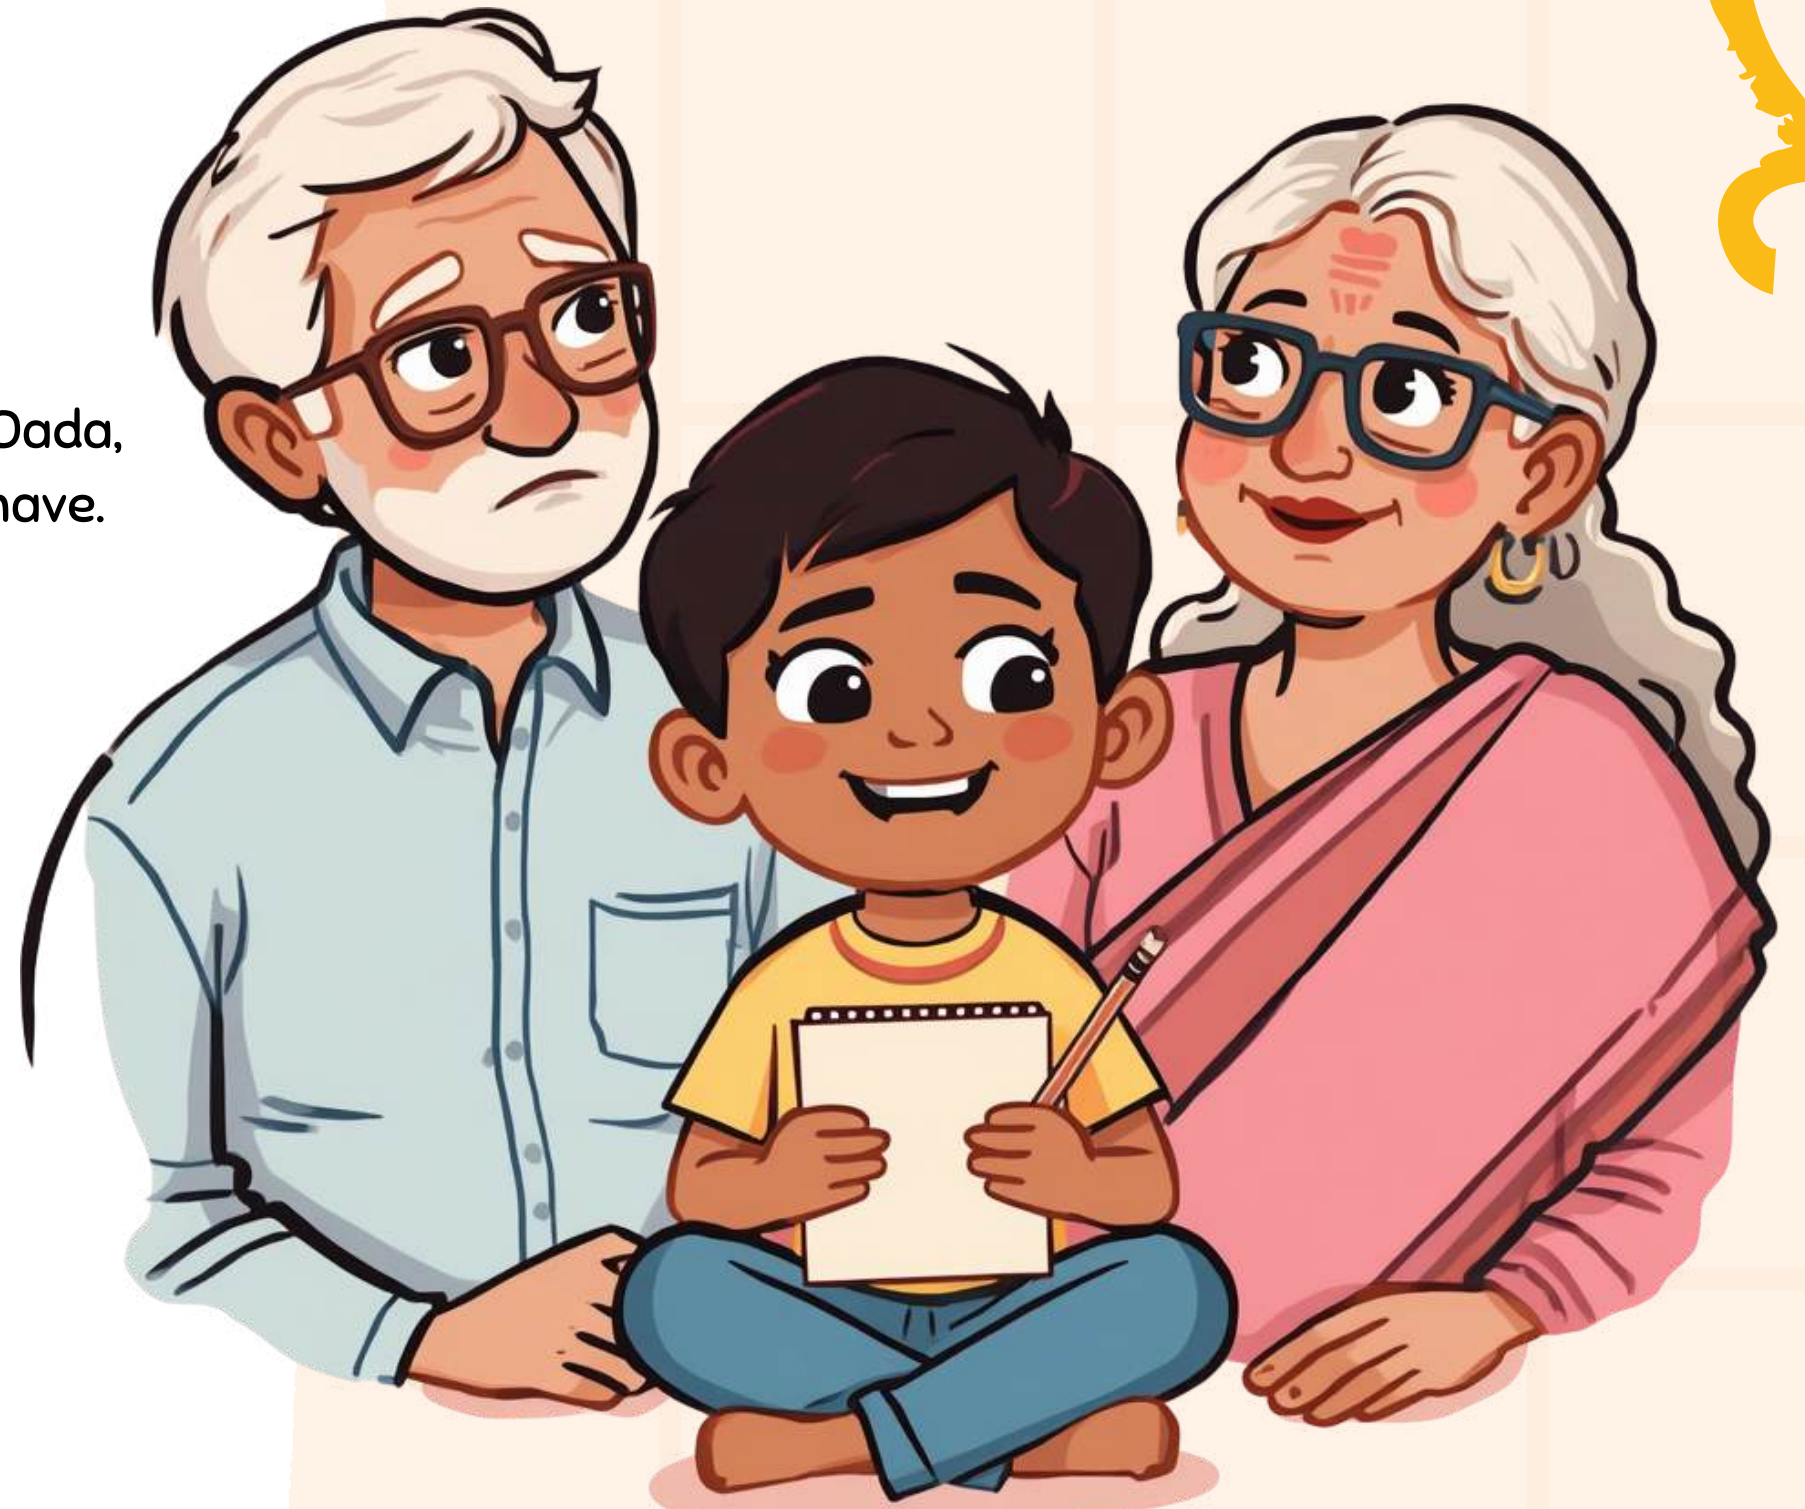

Did they have dimples?

Can they roll their tongue?

Do they have attached or free earlobes?

What Did We Learn Today?

Great job, young scientists! Let's recap the amazing things we discovered about traits and how we inherit them from our families!

Traits come from our families through genetics

Dominant traits show up more often

Your unique traits make you special!
