

OUR SOLAR SYSTEM SCALE MODEL

Using Fruits and Spices to Learn About Planets!

WHAT IS THE SOLAR SYSTEM?

The Solar System is our cosmic neighborhood! It has one big star called the Sun, and eight planets that orbit around it. Each planet is different in size and distance from the Sun. Some planets are tiny, like Mercury! Others are gigantic, like Jupiter! The planets are also very far apart from each other. That's why we can't see all of them with our eyes from Earth. Today, we will learn how to understand the amazing differences in size and distance between all the planets!

The background is a dark blue space-themed illustration. It features several fruits and celestial objects: a large green watermelon on the top left, a green cardamom pod at the top center, a cluster of blue stars at the top center, an orange pumpkin at the top right, a coconut at the top right, a red tomato at the bottom left, a yellow guava at the bottom center, and a slice of watermelon at the bottom right. A small satellite is visible near the watermelon on the left.

PLANET SIZES COMPARED

Mercury: Cardamom Pod

Venus: Gooseberry (Amla)

Earth: Guava

Mars: Tomato

These inner planets are small,
like the fruits we use in our
kitchen!

Jupiter: Watermelon (Largest Planet!)

Saturn: Large Pumpkin

Uranus: Bottle Gourd (Lauki)

Neptune: Coconut

The outer planets are bigger, like
our favorite summer treats!

DISTANCES BETWEEN PLANETS

- The planets in our Solar System are incredibly far apart! To understand how vast these distances are, we can use everyday Indian kitchen items to compare them. Let's explore two amazing distance comparisons using things we use every day!
- Sun to Earth is like the distance from a tiny salt grain to a small red chili pepper! Even though Earth is the third planet from the Sun, it's still millions of kilometers away. If Earth were the size of a chili, the Sun would be over 300 meters away!

BRINGING IT HOME

Here are the fruits and spices you can use to create your own Solar System model at home! Look at how each object represents a different planet.

Cardamom pod = Mercury (smallest)

Gooseberry (Amla) = Venus

Guava = Earth

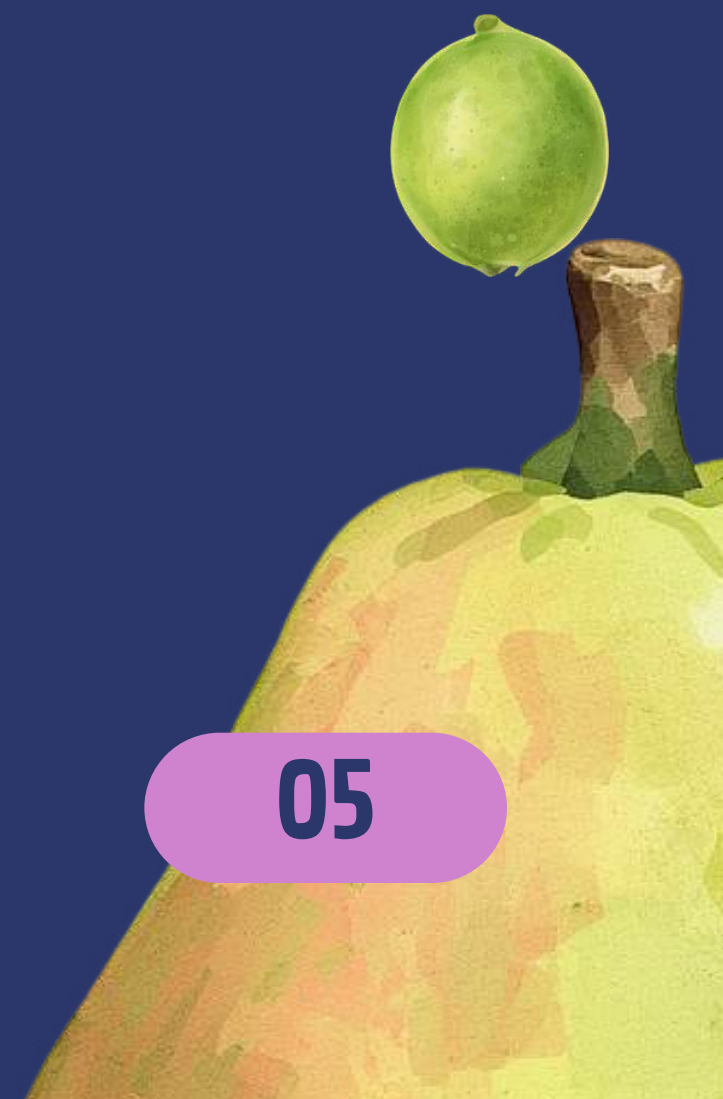

Tomato = Mars

Watermelon = Jupiter (largest!)

Pumpkin = Saturn

Bottle gourd (Lauki) = Uranus

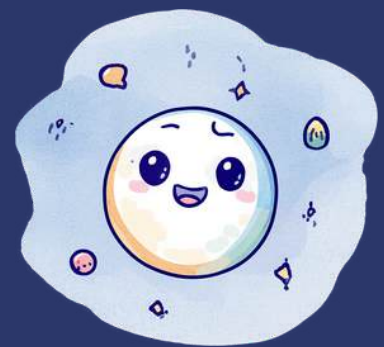

Coconut = Neptune

FUN SOLAR SYSTEM FACT!

Did you know? Jupiter is so big that over 1,300 Earths can fit inside it! That means if you could fit Earths together like building blocks, you'd need more than 1,300 of them to fill up just one Jupiter. Imagine filling a giant watermelon with tiny marbles - that's how big Jupiter is compared to our Earth! Jupiter is also the biggest planet in our Solar System and spins so fast that a day on Jupiter is only about 10 hours long. Can you believe it? The giant planet spins faster than a ceiling fan!

THANK
YOU!
