

Python — Variables & User Input

Learning how to store and get information with Python!

What is Coding?

Coding is like telling a computer what to do!

We use coding to create games, stories, and fun programs.

Meet Python — Our Coding Language

Python is a friendly language that helps us talk to computers.

Think of Python as a magic language for your computer!

What is a Variable?

A variable is like a box where you can store your stuff.

Imagine a box to keep your favorite toys — you can label it and find things easily!

Variables in Python

In Python, a variable stores information like numbers or words.

We can put your age or your name in a variable!

```
name = "Aisha"  
age = 8
```

Making Variables in Python

Let's create a variable in Python!
A variable has a name and a value.

```
name = "Rahul"  
age = 9  
city = "Mumbai"
```

Using Variables

We can use variables to tell the computer what to say.
The print() command shows the value on screen!

```
print(name)  
print(age)
```

Output:
Rahul
9

What is User Input?

User input means the computer asks YOU a question!

Example: What's your favorite color?

Getting User Input in Python

We use `input()` to ask questions and get answers!

```
color = input("What is your favorite color? ")  
print("Your favorite color is", color)
```

Combining Variables and Input

We can ask a question AND use the answer!

```
name = input("What is your name? ")  
print("Hello", name, "! Welcome to coding.")
```

Output:

Hello Priya ! Welcome to coding.

Example: Age Checker

Let's write a program that asks your age!

```
age = input("How old are you? ")  
print("You are", age, "years old!")
```

Example: Favorite Food

Ask about food and reply with a fun message!

```
food = input("What is your favorite food? ")  
print("Yummy! I like", food, "too.")
```

Let's Try It!

Now YOU try! Write code to:

1. Ask your friend's name
2. Ask their favorite game
3. Print a fun message using both!

game

name? ")

Recap — What Did We Learn?

1. Variables store information — like labeled boxes
2. Python uses variables to save words and numbers
3. `input()` lets the computer ask questions
4. `print()` shows the answers on screen
5. We can combine variables and input for fun programs!

Keep Exploring!

Coding is like magic — and you're the wizard!

Keep practicing and have fun with Python!

Thank You!

Thank you for coding with us today!
