

Make a Paper Bridge – Load Test

What is a Bridge?

A bridge helps us cross water or roads. Bridges connect places and help people travel safely from one side to another.

Bridges We See in India

DID YOU KNOW?

Bridges are made in many ways in India.

PAMBAN BRIDGE

A rail bridge in Tamil Nadu that crosses the sea!

BAMBOO BRIDGES

People in Northeast India build bridges from bamboo.

LIVING ROOT BRIDGES

Trees grow into bridges in Meghalaya. Amazing!

What is a Load or Weight?

Load means weight we carry or hold!

01

Chaat-wala's
thela loaded
with bowls of
snacks.

02

Coolie
carrying heavy
luggage on his
head.

03

Dabbawala's
cycle with
many tiffin
boxes.

How Does Folding Make Paper Stronger?

Flat roti bends easily when you pick it up. But when you roll a roti, it becomes stronger and holds its shape better!

Look at mango boxes! They use folded cardboard with zig-zag patterns inside. This makes them strong enough to carry heavy mangoes.

Materials Needed

A4 PAPER

2 sheets of white A4 paper for folding your bridge.

BOOKS

2 thick books to hold your bridge up high.

COINS

1 rupee and 2 rupee coins to test the weight.

KATORI

A small plastic cup or katori to hold your coins.

Building Instructions

01

Fold paper like an accordion (zig-zag folds).

02

Place folded paper between two books.

03

Make sure paper touches both books.

Prediction Time!

How many coins will your bridge hold? Look at your paper bridge and think carefully. Let's make our guesses!

Write down your prediction. Are you ready to test? This is how scientists think before they experiment!

Test and Observe

Place the katori on your bridge. Add coins one by one. Count how many coins until the bridge breaks. Watch carefully and write down what you see!

What Did We Learn?

- Bridges hold weight to help us cross.
 - Folding paper makes it strong.
 - Our guesses helped us think like scientists.
 - When bridges break, we learn and try again!
- Great job! Let's keep exploring!

Thank You
for Learning!
