

CI/CD: THE AUTOMATIC QUALITY CHECKER

THE DAY THE APP CRASHED!

One morning, a developer named Priya made a tiny typo in her code — just one small mistake! Within minutes, millions of kids across India couldn't play their favorite game. Phones showed error messages, tablets froze, and disappointed faces were everywhere. All because of one little bug that nobody checked before it went live!

WHAT IS CONTINUOUS INTEGRATION? (CI)

CI means "Automatic Code Checking"
— automatic checking of your code!
Imagine a magic robot that checks
every new piece of code the moment
you add it. No waiting, no forgetting!
Indian Example: The School Uniform
Check

Think of a magic sensor at your school
gate that automatically checks every
student's uniform — tie, shoes, ID card
— all in seconds!

That's exactly what CI does for code. It
catches mistakes early, before they
cause problems.

CI — THE AUTOMATIC GATEKEEPER

Just like a magic robot at the school gate checks uniforms instantly — "Ding!" for pass, "Buzz!" for fail — CI checks your code automatically! Early bug detection helps coders fix mistakes before they become big problems.

WHAT IS CONTINUOUS DEPLOYMENT?

CD means "Automatic Delivery to Users" — automatic delivery! Once code passes all checks, it goes straight to apps and websites without anyone pressing upload. Think of it like an Automated Snack Factory making Haldiram's Bhujia — machines mix, fry, pack, and load packets onto trucks automatically!

CD — THE INSTANT DELIVERY

No human presses upload — delivery is instant! Watch how snack packets slide through packing, quality checks, and loading stages automatically. Just like this factory, your code travels through the CD pipeline to reach users without anyone clicking a button!

THE CI/CD PIPELINE

Build: Compile the code into an app

Test: Check for bugs automatically

Deploy: Send the app to users instantly

INTERACTIVE PIPELINE ACTIVITY

**Drag the code through Build, Test, and Deploy stages!
Move each code block through the pipeline and watch
what happens. Think about what the robot checks at
each stage — does your code pass or fail?**

WHY AUTOMATION IS OUR BEST FRIEND

Finds mistakes before users see them!
The robot checker catches bugs early, so your app works perfectly when friends download it.

Robots work 24/7 without getting tired!
While you sleep, the CI/CD pipeline keeps checking and delivering code.

Saves precious time for coders! Instead of checking everything manually, you can focus on creating cool new features.

More fun for users! Quick updates mean your friends get new features and fixes faster than ever before.

Makes apps safer and more fun!
Automated testing ensures your games and apps are secure and enjoyable for everyone.

Consistent quality every time! The automated pipeline follows the same careful steps, so nothing gets missed or forgotten.

RECAP: WHAT DID WE LEARN?

CI means automatic checking — like the magic school gate sensor!

CD means automatic delivery — like the Haldiram's snack factory!

Pipeline is the path code takes to reach users quickly and safely!

KEY TERMS TO REMEMBER

Continuous Integration (CI) = Automatic examiner
(Automatic Checker)

Continuous Deployment (CD) = Automatic Delivery

Pipeline = The assembly line for code — the path from
Build to Test to Deploy

QUESTIONS & NEXT STEPS

- "What would you want to automate next?"
- "How can robots help us in other ways?"

Think about your daily life — homework, chores, games.
Where could a helpful robot assistant make things easier
and more fun?

THANK YOU!

CONTACT & RESOURCES

Keep exploring the magic of automation! Here are some fun resources to continue your CI/CD journey:

- Scratch — Build your own projects!
- Code.org — Fun coding games and lessons
- Khan Academy Computing — Learn at your own pace
- Blockly Games — Puzzle-based coding fun

Scan QR codes in class to access these resources directly!
