

SKITTLES RAINBOW SCIENCE EXPERIMENT

FUN WITH COLOURS AND WATER!

WARM-UP: MAGIC WATER WONDER

Watch sugar disappear in warm water!

Today we will learn about dissolving. When you put sugar in warm water and stir it, something magical happens — the sugar disappears!

Key Point: Sugar dissolves when mixed with warm water. The sugar breaks into tiny pieces so small we cannot see them anymore.

WHAT'S IN THE CANDY COATING?

Candies have a colourful sugar coating on the outside! When you look closely at a candy, you can see a shiny coloured shell. This shell is made of sugar mixed with bright colours. It's just like Holi colours floating on water! The colours sit on top and are ready to dissolve when they meet warm water.

PREDICTION TIME! WHAT WILL HAPPEN?

What do WE think will happen when water touches the candies?
Take a moment to guess! Will the colours stay still? Will they move? Will they mix together?
Every guess is a good guess! Scientists always predict before they try. Your ideas matter!

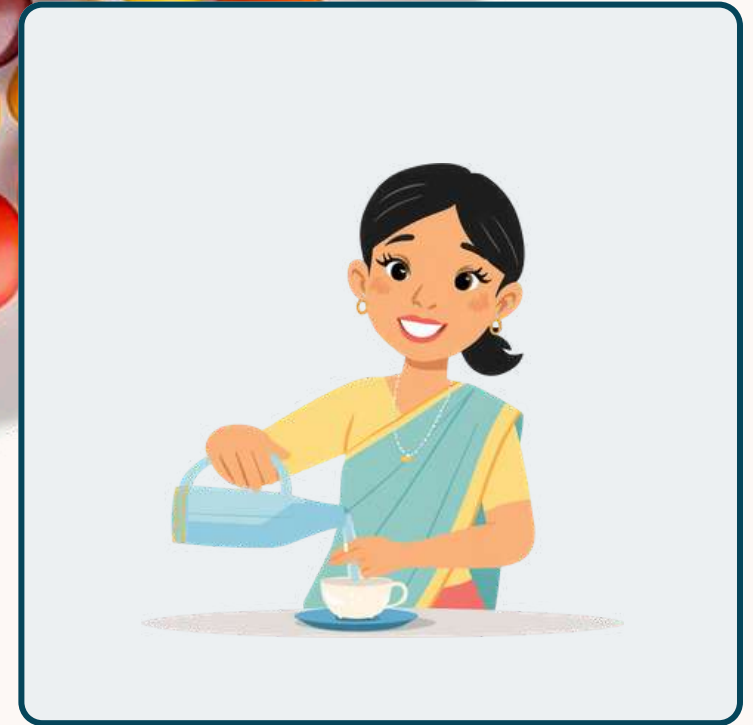

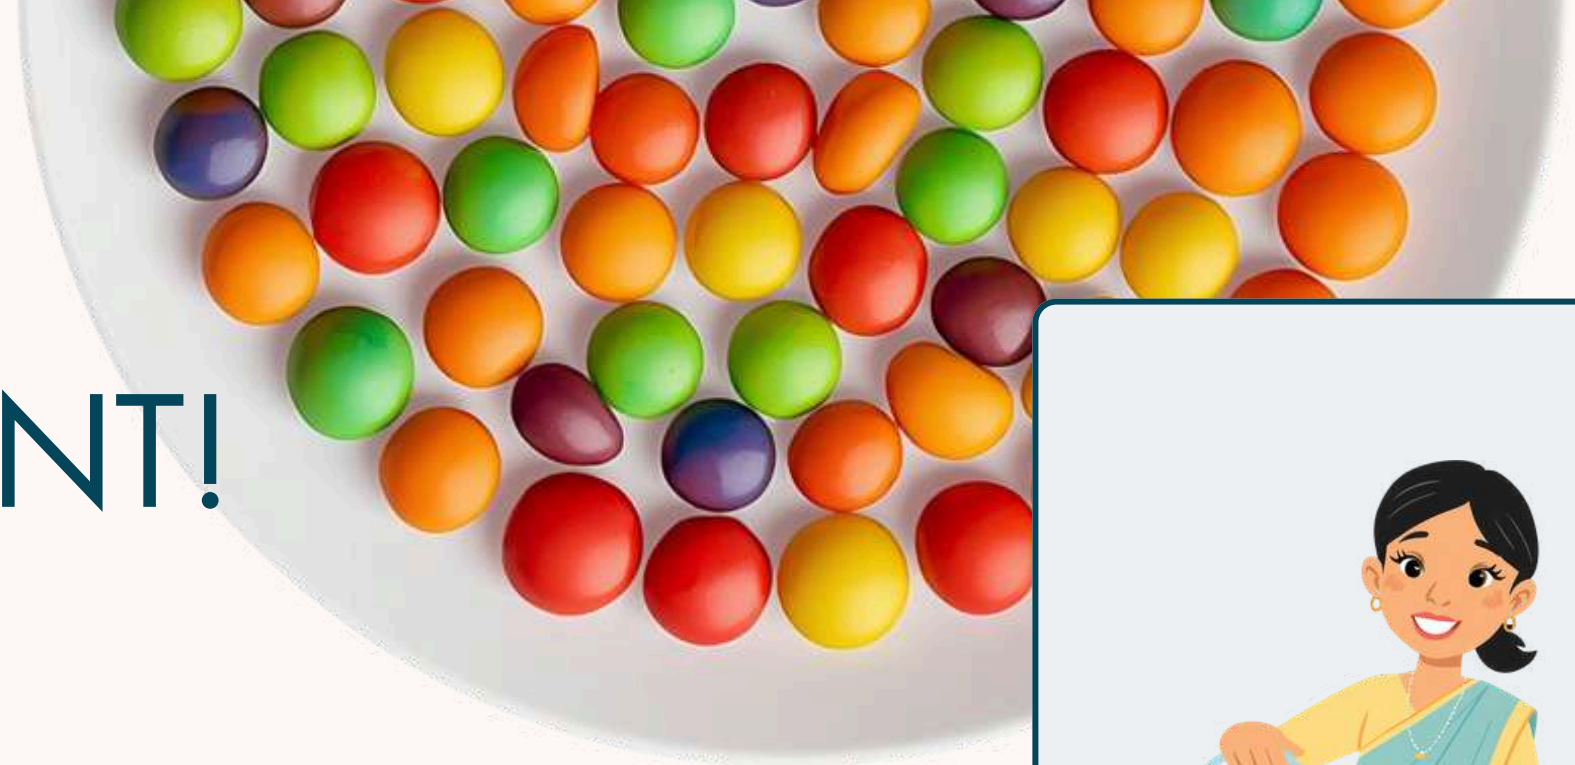

LET'S DO THE EXPERIMENT!

Place colourful candies in a circle on a white plate.

Pour 2–3 tablespoons of warm water in the centre of the plate.

Watch carefully as the colours start to move!

Safety Note: Teacher pours water carefully. Do not touch the plate!

WATCH THE COLOURS TRAVEL!

Look! The colours are moving towards the middle of the plate! Each colour stays in its own lane — they don't mix together. It's like magic rainbow roads!

The warm water helps the coloured sugar coating dissolve and flow inward. Watch carefully as the beautiful rainbow pattern forms right before your eyes!

WHAT DID WE SEE?

Colours move inward toward the middle and stay in their own lanes!
Colours dissolve from the candy shell into the water.
Warm water makes the colours travel faster than cold water.
Remember: No touching the plate during observation!

WHERE ELSE DO WE SEE THIS?

Cooking Magic

The page features decorative rainbow-colored bars at the top and bottom. The top bar consists of vertical stripes in orange, light orange, yellow, green, blue, purple, and light purple. The bottom bar consists of vertical stripes in light purple, purple, blue, green, yellow, light orange, and orange. The left side of the page has horizontal stripes in orange, white, light orange, white, yellow, white, green, white, blue, white, purple, white, and light purple.

WHY WARM WATER?

Warm Water

Warm water helps the candy coating dissolve faster! The colours travel quickly and make a beautiful rainbow. It's like how sugar dissolves fast in hot chai!

Cold Water

Cold water makes the colours move slowly. The candy coating takes longer to dissolve. It's like sugar sitting at the bottom of cold water!

Learn these important science words!

Dissolve

Observe

Predict

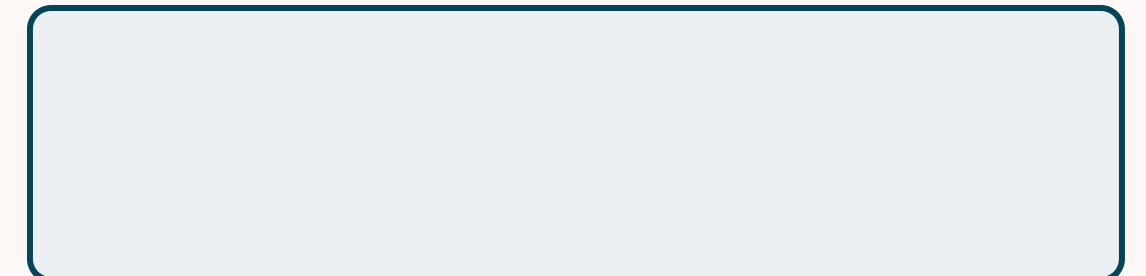

When solid mixes fully into liquid

Watch carefully with your eyes

Make a guess before trying

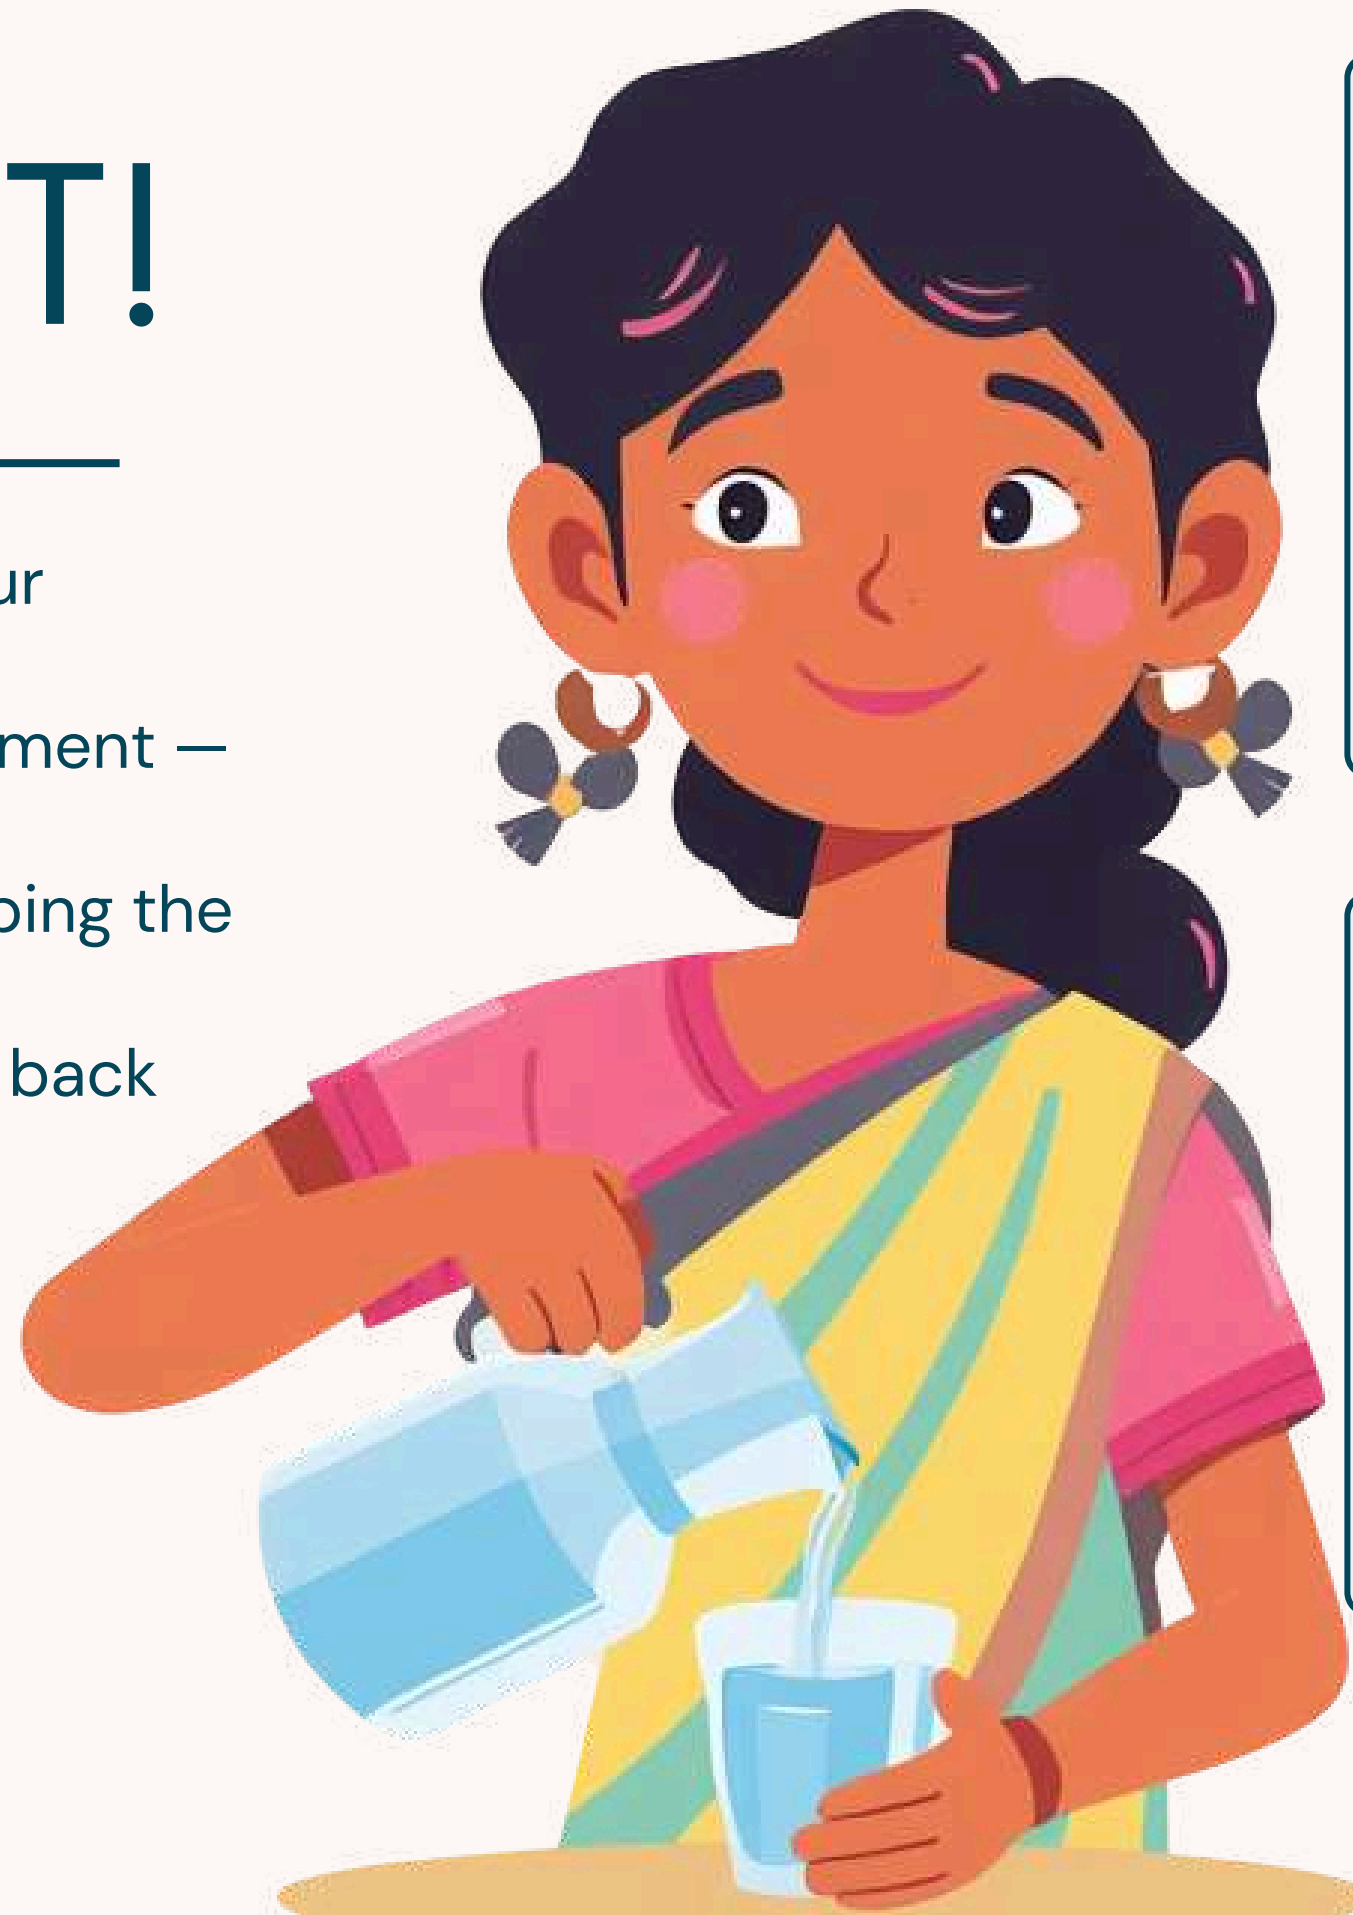

Travel/Flow

How colours move through water

SAFETY FIRST!

Water must be warm, not hot — ask your teacher to check!
Do not eat the candies after the experiment — they have been in water.
Keep your plate flat and still — no bumping the table!
Only the teacher pours the water — sit back and watch the magic!

DRAW WHAT YOU SAW

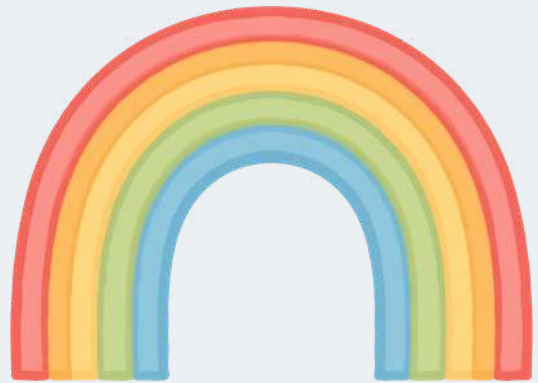

Draw your rainbow pattern on the sheet!
Use your crayons to show the beautiful colours you saw travelling across the plate. Did the colours stay in lanes? Which colour moved the fastest?
Share your drawing with your friends and tell them what you observed!

 Badge Celebration: "You made a rainbow with science!" 

YOU ARE A SCIENTIST!

You just observed something real scientists study!
Every guess you made was important. Every colour you watched
travel taught you something new.
You asked questions, you watched carefully, and you discovered
something amazing — just like real scientists do every day!

THANK YOU AND KEEP EXPLORING!

Thank you for being such wonderful scientists today! Keep wondering and discovering the magic of science all around you.

Try these dissolving activities at home:

- Watch sugar dissolve in your chai or nimbu paani
- See how salt disappears in warm dal water
- Mix food colours in water and observe!
