

Sink or Float?

A Fun Science Adventure!

Grade 1 Science Guide

Chiku's Big Splash!

Let's visit Chiku the Monkey!

Chiku was playing with his favorite plastic cricket ball in the sunny courtyard. Oops! The ball slipped from his hands and went... ***SPLASH*** right into a big bucket of water!

But look closely! The big plastic ball did not go to the bottom. It is staying right on top, swimming happily!

The Tiny Coin Drop!

What happened next?

Chiku wanted to see if his shiny 5-Rupee coin would swim too. He dropped it in... ***CHHAPPAK!*** It went straight down to the dark bottom!

Chiku is scratching his head! Why did the big ball stay on top, while the tiny coin went all the way down? Let's help Chiku solve this mystery!

What is Floating?

Our First Secret Magic Word: FLOAT (Tairna)

FLOAT means when we place an object in water, it stays right on top or close to the surface!

Think of a beautiful, soft marigold flower petal (**Genda Phool**) from a puja garland. When you put it on water, it rests gently on top!

What is Sinking?

Our Second Secret Magic Word: SINK (Doobna)

SINK means when we place an object in water, it drops all the way down to the very bottom!

Think of a solid stone from the garden path. When you drop it into the water, it falls straight down to rest on the ground!

Your Magic Science Box!

Let's set up your home laboratory!

Ask an adult to help you gather these simple things:

- **A Clear Bowl:** Fill it up halfway with clean water.
- **A Cotton Towel:** Put it underneath your bowl to catch any drops or spills.
- **Your Logbook & Pencil:** To draw and tick your smart guesses!

The Spoon and the Leaf!

Let's make a Prediction (Smart Guess)!

Pick up a shiny metal spoon (**Steel Chammach**). It feels cold and heavy for its size. Will it sink or float? Drop it in! Wow! It goes straight down. The spoon **Sinks** !

Now pick up a green leaf. It feels soft and light for its size. Drop it in! Look, it sits on top like a little boat. The leaf

Floats !

The Marble and the Cap!

Time for our next objects!

Hold a small glass marble (**Kancha**) in your hand. It is solid and compact. Make your guess, then drop it! It falls instantly to the bottom. The marble **Sinks** !

Next, take a plastic bottle cap. It is light and hollow. Put it gently on the water waves. Look! It stays right on top. The bottle cap **Floats** !

The Potato and the Coconut!

Let's explore some kitchen treasures!

Take a fresh potato (**Aaloo**). It feels solid and thick. Drop it in!
It goes straight to the bottom. The potato **Sinks** !

Now take a dry piece of coconut shell. It is curved and light.
Place it flat on the water surface. Look! It bobs up and down
happily. The coconut shell **Floats** !

The Katori Paradox!

The Super Challenge Question!

An empty metal bowl (**Steel Katori**) is much larger and heavier than a tiny glass marble. Will the heavy metal Katori sink?

Let's test it! Place it flat and gentle on the water... Look! It is **Floating** beautifully like a real boat! Wow! Why does that happen?

The Secret Rule of Shapes!

Shape Matters Too!

When the Katori is empty and shaped wide like a bowl, it traps a lot of air inside. That trapped air helps hold the heavy metal bowl up so it can float on top!

But watch this: tilt it so water rushes over the side, or fill it with heavy marbles... Oh no! Down it goes. It **Sinks** straight to the bottom!

Help Chiku Sort the Items!

Q1: Where does a solid rubber eraser go?

A: SINK Barrel! It is solid and heavy for its size.

Q2: Where does a wooden ice-cream stick go?

A: FLOAT Barrel! Wood loves to swim on top of waves.

Q3: Where does a metallic key go?

A: SINK Barrel! It is made of heavy metal.

 **Congratulations!** 

You are now an official Junior Water Scientist!

Your Fun Home Mission: Explore your kitchen or balcony with your parents. Find one new object that floats and one that sinks. Draw them in your notebook to show your class next time! Keep exploring!
