

TIME TRAVEL TO 2035

Careers in the Age of AI

Charting the **Bhavishya** of Work

Planrs Academy | Grade 6 Session 1

THE MYSTERY ADVERTISEMENT

Is This Real or From the Future?

Imagine scrolling through a job portal in the year 2035. You see an advertisement that looks like this:

WANTED: Space Tourist Guide

Role: Lead zero-gravity tours on the Moon! Must speak 3 languages and love adventure.

Does this sound like a movie? Today, it might be. But by 2035, this could be a normal job! As technology changes, old jobs disappear and brand new ones—that we haven't even dreamed of yet—take their place.

The Calculator Story

Technology doesn't always take away jobs; it usually **evolves** them. Think about math class 60 years ago.

Before Calculators:

People were hired specifically to do long division and complex multiplication by hand on huge sheets of paper. Their job title was literally "Computer"!

Today:

We use calculators and computers to do the math in seconds. This allows humans to focus on much bigger things, like designing bridges or sending rockets to Mars.

In 2035, AI will be our "Super-Calculator." It will handle the boring data while we do the creative thinking.

From Paper to Logistics

Let's look at a local example. Years ago, the **Dak-Sevak** (Postman) was the only way to send messages. They walked miles to deliver paper letters.

What happened when Email arrived?

- The need for paper letters went down.
- **HOWEVER**, the need for moving physical things went UP!
- Today, those same delivery skills are used by **Zomato, Dunzo, and Amazon** partners.

The job didn't die; it evolved into "Managing Logistics" using digital apps. In 2035, AI will help these partners find the fastest routes automatically!

Guidance, Training, and Fixing

One of the biggest career paths in 2035 will be the **AI Pilot**. AI isn't just a robot that works alone; it needs a human captain to guide it.

Example: The 2035 Farmer

Instead of just ploughing with a tractor, a modern Indian farmer might be an **Agri-Tech Pilot**. They will use AI drones to check soil health in Punjab or Kerala and use AI data to predict exactly when the monsoon will hit their village.

In the future, being a farmer will mean being a high-tech data scientist!

HUMAN-CENTRIC SKILLS

Dil vs. Dimag

AI is incredible at **Dimag** (Logic and Data). It can memorize a million books in a second. But AI struggles with **Dil** (Empathy, Emotion, and Connection).

AI's Superpower (Dimag)

Calculations, Patterns, Memory, Speed.

Your Superpower (Dil)

Creativity, Caring, Ethics, Teamwork.

In 2035, a doctor might use AI to read an X-ray, but the **Human Nurse** will be the one to hold the patient's hand and offer comfort. Both are needed!

1. The AI Ethicist

As AI starts making more decisions, we need "Digital Judges" to make sure those decisions are fair. This is the **AI Ethicist**.

The Job: An AI Ethicist checks if an AI is being biased. For example, if a banking AI is refusing loans to people from a certain village, the Ethicist steps in to fix the logic and ensure everyone is treated equally.

Skills Needed: Fairness, Logic, Philosophy, and Law.

2. Smart City Architect

India is building cities of the future like **GIFT City** and **Dholera**. These cities need architects who can design with AI sensors in mind.

The Job: You won't just design buildings; you'll design "Living Systems." You'll create roads that talk to self-driving cars and buildings that save energy automatically by tracking the sun.

Skills Needed: Architecture, Physics, and Environmental Science.

3. Virtual Reality Tour Guide

In 2035, someone in America might want to visit the **Ajanta Caves** or the **Taj Mahal** without leaving their home. They will hire a **VR Tour Guide**.

The Job: You will wear a special 360-degree camera and walk through these historical sites, telling stories and answering questions for a digital audience across the world.

Skills Needed: History, Storytelling, and Tech-Savviness.

YOUR SUPERPOWER CHECKLIST

What Makes You Irreplaceable?

As you prepare for 2035, focus on the skills that AI cannot easily copy. These are your **Human Superpowers**:

Skill	Why AI Can't Do It Well
Creativity	AI can only remix what it has seen. You can imagine things that have NEVER existed.
Empathy	AI doesn't have "feelings." It can't truly understand what it's like to be sad or happy.
Complex Ethics	AI follows rules. Humans understand the "grey areas" where rules don't always work.

SUMMARY

The Co-Pilot Mindset

- **AI is a Tool:** Like a calculator or a tractor, it helps us work faster.
- **New Jobs:** Careers like AI Ethicist and VR Guide are waiting for you.
- **Lifelong Learning:** The most important skill is the **Sahas** (Courage) to learn new things.
- **The Captain:** AI is the co-pilot, but **YOU** are the captain charting the course.

Can you name 2 jobs that will exist in 2035? Can you identify your own human superpower?
If yes, you are ready to travel to the future!

Your Future Business Card

Before the session ends, grab a piece of paper and design your own business card for the year 2035.

"My name is _____, and in 2035, my job is _____."

What skills do you need to start learning today to get that job? Remember: The **Bhavishya** belongs to those who embrace both technology and their humanity!
